

# Browser Tutorial Search and Filter (en)

Provide a search form and filters for your data on your website. The Browser - the TYPO3-Frontend-Engine - enables searching and filtering in every database. The Browser enables to search in areas like from last month to next month or from 10.000 EUR to 20.000 EUR. Category menus can display in form of a tree view.

Version: 3.9.21, 2012-05-26 - Version is corresponding with the version of the Browser.

Extension Key: browser\_tut\_search\_en - Tutorial for the extension Browser (extkey: browser)

Language: en

Keywords: forAdmins, forDevelopers, forBeginners, forAdvanced, browser, tutorial, frontend-engine, frontend, engine, search

# Screen Shots

## Frontend

### Colored search words

The screenshot shows a search results page for the German Journalists' Association (DJV) website. The search query was "Kündigung wegen Umwelt". The results page has a header with navigation links like Presse und News, Unsere Landesverbände, Kontakt, Impressum, Sitemap, and Hilfe. On the right, there's a sidebar with a menu for DJV-I (Freie, Bild, Pano, Sem, Rech, Freie), DJV-II (Zeit, Tarif, Zeit), and DJV-III (T, Vom, Sitzu, 13. S, 14. S). The main content area displays the search results for "Kündigung wegen Umwandlung der Halbtagsstelle in Ganztagsstelle". It includes a list of categories (Alle A B C D E F G H I J K L M N O P Q R S T U V W XYZ) and a note about permissions.

Illustration 1: Result with six search words

### Tree view and select boxes

The screenshot shows a search results page for green cars on the website http://gruene-autos.org/. The search query was "Alle". The interface includes a search bar with "Begriff suchen" and "Suche" buttons, and a "Zurücksetzen" button. To the right, there's a sidebar for TYPO3 CAMP BERLIN 2012 with a message about meeting the organizers. The main content area shows a tree view of car categories: Manufacturer and models (Alle Typen (37)), Engine types (Alle Antriebe (37)), and Price brackets (Alle Preisgruppen (37)). Below this, a list of car models is shown with their CO<sub>2</sub> emissions: fortwo, smart (3.40 Liter 88g CO<sub>2</sub>), Prius, Toyota (3.90 Liter 89g CO<sub>2</sub>), and Polo, Volkswagen (3.70 Liter 96g CO<sub>2</sub>). Each car model has a small image and a link to its details.

Illustration 2: tree view and select boxes on <http://gruene-autos.org/>

The Browser enables you, to move every category table to a filter.

In the illustration above are four category tables used:

- Manufacturer and models
- Car types
- Engines
- Price-brackets

#### Demo-Website für TYPO3-Entwickler

Dies ist die Demo-Website für TYPO3-Entwickler. Ein Tutorial zeigt am Beispiel von Grüne Autos Schritt für Schritt, wie TYPO3-Entwickler komplexe Datenbanken in nur drei Stunden selbst programmieren können.

Grüne Autos basiert auf dem Browser - TYPO3 ohne PHP. Der Browser ermöglicht die Entwicklung von TYPO3-Erweiterungen ohne eine einzige Zeile PHP. Der Aufwand für Entwickler reduziert sich auf bis zu ein Achtel, die Entwicklung geht bis zu acht Mal schneller.

Illustration 4: Filter can control itselfs: items without any hit will hidden.

See the tutorial 'Green Cars - Dynamic Filter' on page 35 below.

## Check boxes

The screenshot shows a search interface for TYPO3 extensions. At the top, there's a search bar with 'Begriff suchen' and 'Suche in: Volltextsuche'. Below it, there are two sections of checkboxes:

- Status Label (z.B. alpha, beta, stable, ...)**
  - Alpha (1450)
  - Beta (1902)
  - Experimental (125)
  - Obsolete (210)
  - Other (27)
  - Stable (1819)
  - Test (38)
- Kategoriebezeichnung**
  - Backend (521)
  - Documentation (0)
  - Example (196)
  - Frontend (1050)
  - Miscellaneous (784)
  - Module (397)
  - Plugin (2410)
  - Services (142)
  - Templates (34)

At the bottom, there are buttons for 'Sortieren nach: Upload-Datum (absteigend)', 'Aktualisieren', and 'Zurücksetzen'.

Illustration 5: Example with check boxes.

## Category menu and areas

Montag (5) Dienstag (7) Mittwoch (7) Donnerstag (9) Freitag (7) Samstag (9) Sonntag (3)

The screenshot shows a category menu with tabs: Alle Plätze, Reitbahn I, Reitbahn II, Allwetterplatz, and Dressurviereck/Zelt. A red arrow points from the text above to the 'Allwetterplatz' tab. Below the tabs is a grid representing time slots (Mo, 13. Jun) and areas (Reitbahn I, Reitbahn II, Allwetterplatz, Dressurviereck/Zelt). The grid contains letters R and V, indicating availability or status.

Mo, 13. Jun	Reitbahn I	Reitbahn II	Allwetterplatz	Dressurviereck/Zelt
08:00 - 11:00			R	R
11:00 - 14:00			R	R
14:00 - 17:00	R	V	R	R
17:00 - 20:00	R	V	R	R
20:00 - 23:00			R	R

Illustration 6: Example for a category menu and an area

The illustration above displays a category menu: a filter in form of a list.

And this list is an area. Area means values from one value to a value like from the first day of this week to the last day of this week.

## Backend

The screenshot shows a treeview interface for selecting manufacturer and models. On the left, under 'Selected Items:', 'Ford' and 'Fiesta' are listed. On the right, under 'Available Items:', the tree structure is shown:

```

        Green Cars: Manufacturer
            ├── Audi
            ├── Daihatsu
            └── Ford
                ├── Fiesta
                ├── Focus
                └── Honda
            └── Mazda
    
```

Illustration 7: Treeview in the backend

# Introduction

## What does the Tutorial do?

This is a tutorial for the extension Browser (extkey: browser).

It is only

- a step-by-step introduction for the configuration of the search functionality and filters.

If you are interested in other issues, please note the section "Further Informations" below.

## What does the Browser Search and Filter do?

### Search

- Searching in displayed and in non displayed columns.
- Searching for words and phrases. Example:
  - Sword: "My Phrase" Word another word
  - Will search for "My Phrase" or "Word" or "another" or "word".
- The search is case insensitive.
- The search is configurable:
  - You can search in every column of every table. It doesn't matter, if table or field are displayed in the current view.
  - You can configure the search form and the colours of the result items among others.

### Filter

- Filter your data by category menus, checkboxes, radiobuttons, selectboxes and treeviews
  - Filter are configurable. Examples for possibilities:
    - Items are cObjects
    - You can add a first item like "All Cars"
  - Filter are dynamically. If there isn't any hit, filter items won't be displayed. It's configurable.
  - Filter count hits. It's configurable.
  - Filter can handle data areas. Example for a data area: from January to December, from 10.000 EUR to 20.000 EUR

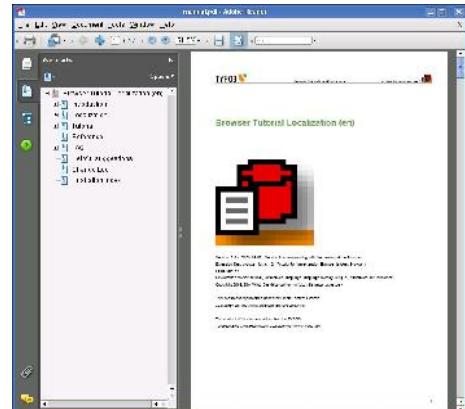

Illustration 8: Tutorial in PDF format

## Further Information

### This tutorial in PDF format

You find this manual as PDF file at

- doc/manual.pdf
- [http://typo3-browser.de/typo3conf/ext/browser\\_tut\\_search\\_en/doc/manual.pdf](http://typo3-browser.de/typo3conf/ext/browser_tut_search_en/doc/manual.pdf)

### Browser Manual and Browser Tutorial Basics

Manual: The Browser has it's own manual (with the reference of course).

- HTML [http://typo3.org/documentation/document-library/extension-manuals/browser\\_manual\\_en/current/](http://typo3.org/documentation/document-library/extension-manuals/browser_manual_en/current/)
- PDF: [http://typo3-browser.de/typo3conf/ext/browser\\_manual\\_en/doc/manual.pdf](http://typo3-browser.de/typo3conf/ext/browser_manual_en/doc/manual.pdf)

Tutorial Basics: A lot of step-by-step introductions.

- HTML: [http://typo3.org/documentation/document-library/extension-manuals/browser\\_tut\\_basics\\_en/current/](http://typo3.org/documentation/document-library/extension-manuals/browser_tut_basics_en/current/)
- PDF: [http://typo3-browser.de/typo3conf/ext/browser\\_tut\\_basics\\_en/doc/manual.pdf](http://typo3-browser.de/typo3conf/ext/browser_tut_basics_en/doc/manual.pdf)

# Tutorial search

## Example with tt\_news

### Requirements

You need

- the extension Browser of course
- the extension tt\_news<sup>1</sup>
- a page with
  - the plugin browser
    - set in the tab [General] the type of the header to hidden
    - set in the tab [Plugin] the startingpoint to your sysfolder with the news records
  - an extension template
    - with the include static template of the browser
    - and in the setup field the TypoScript from below.

### TypoScript

```
plugin.tx_browser_pi1 {
    views {
        list {
            1 {
                select = tt_news.title, tt_news_cat.title
            }
        }
        single {
            1 {
                select = tt_news.title, tt_news.short, tt_news.bodytext, tt_news_cat.title
            }
        }
    }
}
```

This is the TypoScript for

- a list view with the fields tt\_news.title and tt\_news\_cat.title and
- a single view with the fields tt\_news.title, tt\_news.short, tt\_news.bodytext, tt\_news\_cat.title.

### Result in the Frontend

The Result in the frontend should look like the screen shot below, if you are using the German language:

#### Meine Liste

Begriff suchen  Suche Zurücksetzen  
Alle 0-9 ABCDEFGHIJKLMNOPQRSTUVWXYZ Andere  
1 bis 20 von insgesamt 64 Datensätzen  
«« 1-20 21-40 41-60 61-64 »»»

Klicken Sie auf einen Buchstaben oder senden  
Sie eine Suchabfrage.

Illustration 9: Frontend with a simple example with  
tt\_news

<sup>1</sup> You can take every other extension, but than you need a TypoScript with its tables and fields instead of tt\_news.

## Test it!

Familiarize you with the search.

### Example with two words

Search for the words: Browser Erweiterung

#### Meine Liste

browser erweiterung    Suche    Zurücksetzen

Suche nach **browser** und **erweiterung** hat folgendes Ergebnis:

Titel:	Titel:

Title Wrap (i.e. <h1>|</h1>)

Group Title Wrap (i.e. <h2>|</h2>)  
<h2>|</h2>

Limit: records per page (from 1 to 1000)  
3

Display: Navigation  
 A-Z- Browser  Page Browser

Display: Records  
 Empty List at Start

2

Search

Configured ▾

Search: Tutorials  
 Search: http://typo3.org/extensions/repository/view/browser\_tut\_search\_en/current/

Search: Form

Display the form  with result phrase

with colored swords (list view)  with colored swords (single view)

Search: Checkpoint for colored search words in the single view  
 Yes, I know, there will be a piVar for the sword. The sword in the URL isn't good for search engines in general.

Search: wildcards  
Self-acting (recommended) ▾

Search: char for a wildcard (i.e. "\*")  
\*

Illustration 16: The Browser plugin. Tab [List] (1) with the search menu (2)

1. Plugin Tab [Lists]
2. Set the Search mode to [Configured]

#### Comment

- Search: Tutorials  
Dummy check box for information only. link to the online tutorial
- Search: Form
  - Display the form
  - with result phrase  
Result phrase will appear below the form.

- [X] with colored swords (list view)  
Search words will be colored in the list view. But there is an exclusion: Search words linked values won't be colored.
- [ ] with colored swords (single view)  
Search words will be colored in the single view. But there are some exclusions: Search words in children records and linked values won't be colored.
- Search: Checkpoint for colored search words in the single view  
Dummy check box for information only.  
If you have the search word in the URL, you can get different links to the same content. Search engines doesn't like it!
- Search: wild-cards
  - Self-acting (recommended)  
Search words will wrapped with wild-cards by default
  - User have to add wild-cards
- Search: char for a wild-card  
You can use another wild-card. Be aware that are conflicts with the SQL queries: '%' isn't possible for example.

## List without any Search Form

Illustration 20: Search form without any result phrase

## Configuring the Result Phrase

If you want change the phrase of the result phrase, please configure

```
plugin.tx_browser_pi1.displayList.display.searchform.resultPhrase {
    searchFor.value = Search for
    searchFor.lang.de = Suche nach
    ...
}
```

## Search results with other Colors

If you like to want less, more or other colors for the search result, please configure the array wrapSwordInResult.

Be aware that displayList and displaySingle have there own search form array.

```
// List View
plugin.tx_browser_pi1.displayList.display.searchform {
    searchform {
        wrapSwordInResults {
            0 {
                wrap = <span style="background:#ffff7f">|</span>
            }
            1 {
                wrap = <span style="background:#b3ffb2">|</span>
            }
            ...
        }
    }
}

// Single View
plugin.tx_browser_pi1.displaySingle.display.searchform {
    searchform {
        wrapSwordInResults {
            0 {
                wrap = <span style="background:#ffff7f">|</span>
            }
            1 {
                wrap = <span style="background:#b3ffb2">|</span>
            }
            ...
        }
    }
}
```

## Extending the search

Usually visitors of a website can search in the displayed columns only.

The Browser enables to search in every table and field you like - independing of the display mode.

### Example

You want to display in the list view only the fields: tt\_news.title, tt\_news\_cat.title.

But the visitor should search in the fields: tt\_news.title, tt\_news.short, tt\_news.bodytext.

### TypoScript

```
plugin.tx_browser_pi1 {
    views {
        list {
            1 {
                select = tt_news.title, tt_news_cat.title
                search = tt_news.title, tt_news.short, tt_news.bodytext
            }
        }
    }
}
```

## Search and filter

By default the search doesn't respect any filter. This has an effect only, if you are using filters or a category menu.

The effect is, that

## Security

### The Minimum Length of a Sword Word

The default for the minimum length of a sword word is three chars. If a word is shorter, it will be removed from the sword.

If you want to increase or decrease the minimum length, please configure minLenWord:

```
plugin.tx_browser_pi1.advanced {  
    security {  
        sword {  
            minLenWord = 3  
        }  
    }  
}
```

### MySQL Security: add Slashes

The Browser secures swords with the PHP method mysql\_real\_escape\_string().

mysql\_real\_escape\_string() adds slashes to \x00, \n, \r, \, ' and \x1a, but not to \%.

The Browser adds a slash to \% too. If you don't like it, please configure csvChars:

```
plugin.tx_browser_pi1.advanced {  
    security {  
        sword {  
            addSlashes {  
                csvChars = %  
            }  
        }  
    }  
}
```

If you need slashes for more than the \%, please add the chars to csvChars comma separated like in the code below:

```
plugin.tx_browser_pi1.advanced {  
    security {  
        sword {  
            addSlashes {  
                csvChars = %, `,  
            }  
        }  
    }  
}
```

# Tutorial filters and a category menu

You can extend the search form with filters in form of

- checkboxes,
- radiobuttons and
- selectboxes.

And you can add a

- category menu

to your HTML template within or without the search form.

## The Common Ground

### Both have the same Effect

There is no difference between filters and a category menu in principle. Both enables the visitor of your website to search structured. Structured means:

Visitors can limit the amount of records – they can search for data – by given categories like:

- Display all news with the category “society”.
- Display all events, which will happen “next week”.

The difference between filters and a category menu isn't the effect but the rendered HTML code.

## The Difference

### Filters are a Part of an HTML Form

Filters have to be rendered as a COA object CHECKBOX, RADIOBUTTON or SELECTBOX. All of them are a part of an HTML form. Non item of them will be rendered as a link directly. All of them have to be placed within the Marker **###SEARCHBOX###**.

#### AJAX

Because of AJAX filters have to stand outside the `<div class="listarea">`.

### A Category Menu is a List of Links

But every items of a CATEGORY\_MENU will be rendered as a link like the items of your main menu. A CATEGORY\_MENU isn't a part of a form. A CATEGORY\_MENU has to be placed within the marker **###CATEGORY\_MENU###**.

#### AJAX

Because of AJAX filters have to stand inside the `<div class="listarea">`.

#### Disabled by default

The subpart **###CATEGORY\_MENU###** is disabled by TypoScript by default. The subpart will removed from the HTML template – you won't have any waste in your code.

If you are using the category menu please enable in your global or local configuration:

```
displayList.display.category_menu = 1
```

## Workflow

1. Add to your template the table.field, which should used as a filter or category menu
  1. You have to place it within the **###SEARCHBOX###** marker, if you like to use a filter as a checkbox, radiobutton or selectbox.
  2. You have to place it within the **###CATEGORY\_MENU###** marker, if you like to use a filter as a category menu.

2. Add to your TypoScript the table.field
3. Copy one of the Content Objects CATEGORY\_MENU, CHECKBOX, RADIOPUSHON or SELECTBOX from the master\_templates array to the table.field.
4. Configure the category menu , checkbox, radiobuttons or selectbox.

A good example for filter is the extension Green Cars. Green Cars provides the German case story "Fallstudie grüne-autos.org - Datenbank in drei Stunden". It explains very well, what you have to know, if you want to use filters.

Be aware that you can filter data of the local table and foreign tables – all tables – from version 3.6.0.

See

- Extension Green Cars in the TYPO3 repository  
[http://typo3.org/extensions/repository/view/green\\_cars/current/](http://typo3.org/extensions/repository/view/green_cars/current/)
- Fall Studie "Grüne Autos"  
[http://typo3.org/extensions/repository/view/green\\_cars/current/info/?tx\\_terfe\\_pi1%5BdownloadFile%5D=doc%252Fall\\_studie.pdf](http://typo3.org/extensions/repository/view/green_cars/current/info/?tx_terfe_pi1%5BdownloadFile%5D=doc%252Fall_studie.pdf)

	<b>Volkswagen</b>	<b>3.70</b> Liter <b>96</b> g CO <sub>2</sub>

Illustration 21: <http://gruene-autos.org/> with three selectboxes

## HTML Template

Add to your template the table.fields you want to use as filters like in the snippet below.

See line 10 to 12.

```

1. <!-- ###TEMPLATE_LIST## begin -->
2.      ###MY_TITLE###
3. <!-- ###SEARCHFORM## begin -->
4.      <div class="searchbox searchbox-###VIEW##-###MODE##">
5.          <form action="###ACTION##" method="post" name="Testform">
6.              <input type="hidden" name="no_cache" value="1" />
7.              <input class="sword" type="text" name="tx_browser_pil[sword]"
                   onfocus="if(this.value =='###SWORD_DEFAULT##')
                   this.value=''" value="###SWORD##" />
8.              <input class="button" type="submit" value="###BUTTON##" />
9.              <input class="button" type="button" onclick="location='###MY_URL##'"
                   value="###MY_RESET##" />
10.             ####TX_BZDSTAFFDIRECTORY_LOCATIONS_TITLE##
11.             ####TX_BZDSTAFFDIRECTORY_FUNCTIONS_TITLE##
12.             ####TX_BZDSTAFFDIRECTORY_GROUPS_GROUP_NAME##
13.             ####RESULTPHRASE##"
14.         </form>
15.     </div><!-- ###SEARCHFORM## end -->
16.     ...
17. ...

```

## TypoScript

Add the table.fields like in the snippet below.

Line 6: Add the array filter.

Line 7, 10, 13: Add the tables.

Line 8, 11, 14: Add the fields.

qLine 8, 11, 14: Copy to the fields the selectbox from the array master\_templates

```
1. plugin.tx_browser_pil {
2.   views {
3.     list {
4.       1 {
5.         ...
6.         filter {
7.           tx_bzdstaffdirectory_locations {
8.             title < plugin.tx_browser_pil.displayList.master_templates.checkbox
9.           }
10.          tx_bzdstaffdirectory_groups {
11.            group_name < plugin.tx_browser_pil.displayList.master_templates.radiobuttons
12.          }
13.          tx_bzdstaffdirectory_functions {
14.            title < plugin.tx_browser_pil.displayList.master_templates.selectbox
15.          }
16.        }
17.        ...
18.      }
19.    }
20.  }
21. }
```

## TypoScript Object Browser

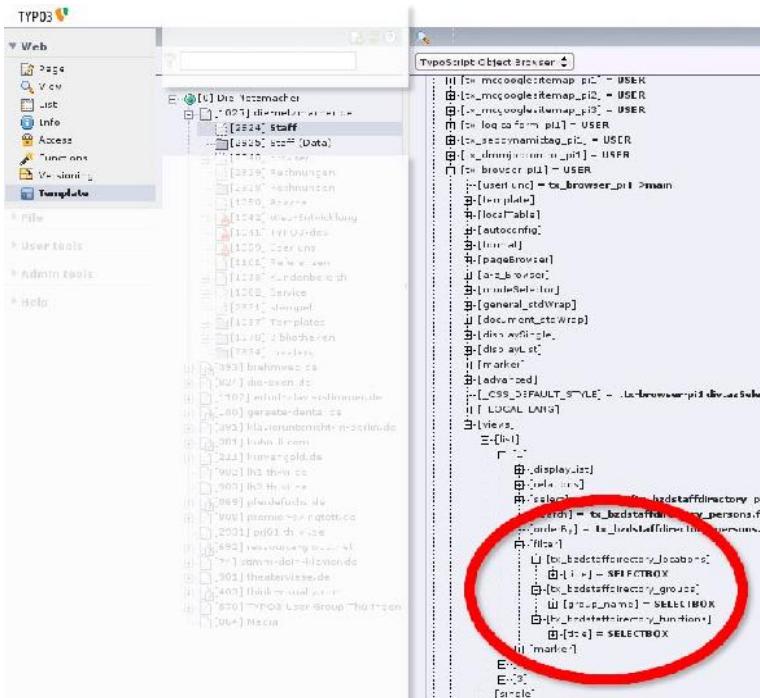

Illustration 22: The object SELECTBOX

If you want to configure a filter / select box, please open the field array in your TypoScript Object Browser.

You will see a lot of commented properties like in the illustration below:

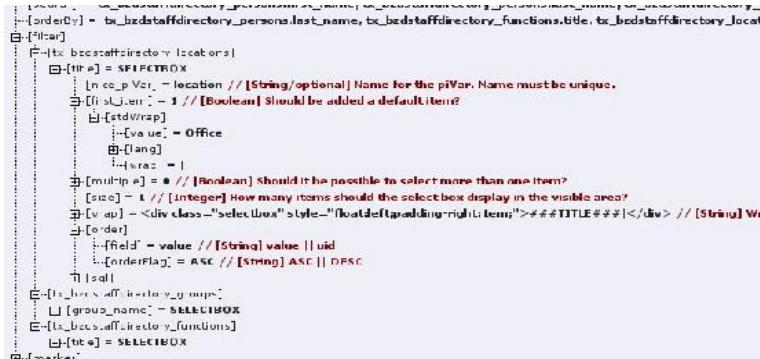

Illustration 23: The object SELECTBOX with some properties.

That's it!

# Tutorial tree view

## Restrictions

If you want to know, if a tree view is the solution for your demands, please refer to "Restrictions" on page 29 below.

### Grüne Autos

The screenshot shows the TYPO3 Backend interface for the 'Grüne Autos' extension. On the left, a tree view lists manufacturers like Audi, Daihatsu, Ford, Honda, Mazda, Toyota, Volkswagen, Golf, Passat, Polo, Touran, Volvo, and smart. On the right, there are three dropdown menus for filtering by Type, Drive, and Price group. Below the tree view, there's a search bar, a sorting dropdown, and a navigation menu from A to Z. At the bottom, two car cards are shown: a Smart Fortwo (3.40 Liter 88g CO<sub>2</sub>) and a Toyota Prius (3.90 Liter 89g CO<sub>2</sub>). The card for the Toyota Prius has a small error in the text.

Illustration 24: Tree view example

## What does this tutorial do?

We like to display categories in a tree view. This tutorial demonstrates, how to extend your own extension. We take the extension green\_cars and extend it with a tree view like

- manufacturer 1
  - model a
  - model b
  - model c
- manufacturer 2
  - ...

## Step overview

- Installing of the extension cps\_tcatree
- Define the dependency of cps\_tcatree
- Extending the SQL table manufacturer with a parent field for uids
- Extending the TCA configuration for the table manufacturer
- Extending the HTML template with a marker for the tree view
- Extending the TypoScript with a configuration for the tree view

## cps\_tcatree

### Installing

The screenshot shows the TYPO3 Extension Manager interface. On the left, there's a sidebar with navigation links like WEB, FILE, USER TOOLS, and ADMIN TOOLS. Under ADMIN TOOLS, 'Extension Manager' is selected. The main area is titled 'Extension Manager' with sub-sections 'Group by: Type' and 'Show: Details'. It shows a list of 'Loaded Extensions' with a search bar below. One extension is listed: 'Record tree for TCA cps\_tcatree' version 0.3.0, which is marked as 'Local' and 'Alpha'.

Illustration 25: Installing cps\_tcatree

- Install the extension "Record tree for TCA" (extkey: cps\_tcatree).
- Enable the extension.

### Define the dependency in ext\_emconf.php

Define the dependency to cps\_tcatree in the configuration of your extension. The definition of the dependency isn't obligatory but is best practise. See lines 'dependencies' and 'constraints' in the snippet below. The file is ext\_emconf.php.

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano ext_emconf.php

<?php
...
$EM_CONF[$_EXTKEY] = array(
    ...
    'dependencies' => 'browser, cps_tcatree',
    ...
    'constraints' => array(
        'depends' => array(
            'browser' => '3.9.6-0.0.0',
            'cps_tcatree' => '0.3.0-0.0.0',
        ),
        ...
    ),
    ...
)
;
.....
?>
```

### Extending the SQL table manufacturer

We need a field for the parent uid of each category, which should a child of another category. We extend the SQL table with the field uid\_parent. See the snippet below.

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano ext_tables.sql

...
#
# Table structure for table 'tx_greencars_manufacturer'
#
CREATE TABLE tx_greencars_manufacturer (
    uid int(11) NOT NULL auto_increment,
    pid int(11) DEFAULT '0' NOT NULL,
    uid_parent int(11) DEFAULT '0' NOT NULL,
    ...
);
...
```

The table tx\_greencars\_manufacturer is now able to administer subcategories.

## Extending the TCA configuration

### Make the parent uid known to other tables

Tables which are connected with the manufacturer table, has to know about the parent uid of the manufacturer table. We configure ext\_tables.php like in the TCA snippet below. See the line with 'treeParentField':

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano ext_tables.php

...
$TCA['tx_greencars_manufacturer'] = array (
    'ctrl' => array (
        'title'      => 'LLL:EXT:green_cars/locallang_db.xml:tx_greencars_manufacturer',
        'label'       => 'title',
        'tstamp'     => 'tstamp',
        'crdate'     => 'crdate',
        'cruser_id'  => 'cruser_id',
        'treeParentField' => 'uid_parent',
        ...
    ),
);
...
```

For your background: The configuration of 'treeParentField' is a demand of the extension cps\_tcatree. And it is a demand of the extension TYPO3 Browser, which is using the TCA based on cps\_tcatree.

### Extend the TCA form

You have to edit two items and to add the field configuration.

Please add the field name 'uid\_parent' to

- showRecordFieldList
- types.X

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano tca.php

...
$TCA['tx_greencars_manufacturer'] = array (
    ...
    'interface' => array (
        'showRecordFieldList' => 'hidden,title,uid_parent'
    ),
    ...
    'columns' => array (
        ...
        'uid_parent' => array (
            'exclude' => 0,
            'label'   => 'LLL:EXT:green_cars/locallang_db.xml:tx_greencars_manufacturer.uid_parent',
            'config'  => array (
                'type'          => 'select',
                'form_type'    => 'user',
                'userFunc'     => 'tx_cpstcatree->getTree',
                'foreign_table'=> 'tx_greencars_manufacturer',
                'treeView'     => 1,
                'expandable'   => 1,
                'expandFirst'  => 0,
                'expandAll'    => 0,
                'size'         => 1,
                'minitems'     => 0,
                'maxitems'     => 2,
                'trueMaxItems'=> 1,
            ),
        ),
        ...
    ),
    ...
),
'types' => array (
    '0' => array('showitem' => 'hidden;;1;;1-1-1, title;;;;2-2-2,uid_parent')
),
...
)
```

```
)  
...  
;
```

If you take for the label of the field uid\_parent a LLL-value like in the snippet above, please add the value to your locallang file.

If you want to know more about the configuration and possibilities of the uid\_parent field, please refer to the manual of the cps\_tcatree.

## Update your extension

You have to update your extension like in the illustration below. The field "uid\_parent" will added to the manufacturer SQL table.

Illustration 26: Update your extension. The field uid\_parent will added to the SQL table

## Ready for tree ordering!

Clear the Cache of your TYPO3 backend.

Open the manufacturer form. You will get a result similar to the illustration below.

Illustration 27: Manufacturer table with the uid\_parent field

Your job is now, to add models and to allocate manufacturers.

After finishing you should have a result like in the illustration below.

**Edit Green Cars: Manufacturer "Golf" on page "Grüne Autos - Autos"**

**Manufacturer**

Golf

**Superior Category**

Selected Items: Volkswagen

Available Items:

- Green Cars: Manufacturer [Fr]
  - Audi
  - smart
  - Suzuki
  - Toyota
  - Volkswagen
    - Golf
    - Passat
    - Polo
    - Touran
    - Volvo

Illustration 28: Tree view with manufacturers and models in the backend

## Local table with tree view

tx\_greencars\_main.manufacturer is connected with the manufacturer table in our example green\_cars.

We have to update the configuration of the field manufacturer of the table tx\_greencars\_main in the TCA. See the snippet below.

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano tca.php

...
$TCA['tx_greencars_main'] = array (
    ...
    'columns' => array (
        ...
        'manufacturer' => array (
            'exclude' => 0,
            'label' => 'LLL:EXT:green_cars/locallang_db.xml:tx_greencars_main.manufacturer',
            'config' => array (
                'type' => 'select',
                'minitems' => 0,
                'size' => 3,
                'maxitems' => 5,
                'form_type' => 'user',
                'userFunc' => 'tx_cpstcatree->getTree',
                'treeView' => 1,
                'expandable' => 1,
                'expandFirst' => 1,
                'expandAll' => 0,
                'foreign_table' => 'tx_greencars_manufacturer',
                'foreign_table_where' => 'AND 1 ORDER BY tx_greencars_manufacturer.uid',
                'suppress_icons' => 1,
                'wizards' => array(
                    ...
                ),
            )
        ),
    ...
)
```

If you want to know more about the configuration and possibilities of the uid\_parent field, please refer to the manual of the cps\_tcatree.

The form should look like in the illustration below now.

Illustration 29: Tree view - local table with the category field

## Frontend works

### HTML template

You have to add a table field marker to the HTML template within the search form section. See the line with the marker `###TX_GREENCARS_MANUFACTURER.TITLE###` in the HTML snippet below.

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano res/default tmpl

...
<!-- ###SEARCHFORM## begin -->
<div class="searchbox searchbox-###VIEW##-##MODE##">
<form action="###ACTION##" method="post" >
<fieldset>
<legend>###MY_SEARCH_LEGEND###</legend>
<input type="hidden" name="no_cache" value="1" />
<input class="sword" type="text" name="tx_browser_pil[sword]"
  onfocus="if(this.value == '###SWORD_DEFAULT###') this.value=''"
  value="###SWORD###" />
<input class="button" type="submit" value="###BUTTON###" />
<input class="reset" type="button"
  onclick="location='###MY_URL###'" value="###MY_RESET###" />
<!-- Add filter with the ###TABLE.FIELD## syntax and configure your filter
  with TypoScript -->
<br />
###TX_GREENCARS_MANUFACTURER.TITLE###
###TX_GREENCARS_TYPE.TITLE###
###TX_GREENCARS_ENGINE.TITLE###
###TX_GREENCARS_PRICEBRACKET.TITLE###
</fieldset>
...

```

## TypoScript

You have to add a TypoScript configuration for the filter. filter.tx\_greencars\_manufacturer is added in the TypoScript snippet below.

```
wwwrun@s15315906: .../typo3conf/ext/green_cars> nano static/browser/setup.txt

...
plugin.tx_browser_pil {
    ...
    views {
        list {
            1 {
                ...
                filter {
                    tx_greencars_manufacturer {
                        title < plugin.tx_browser_pil.displayList.master_templates.category_menu
                        title {
                            first_item {
                                cObject {
                                    20 {
                                        data = LLL:EXT:green_cars/locallang_db.xml:filter_phrase.manufacturer
                                    }
                                }
                            }
                        }
                        wrap = <div class="category_menu category_menu_treeview">|</div>
                    }
                }
            }
        }
    }
}
...
```

## Result

The illustrations below displays an example with the tree view in the initial mode (collapsed) and after opening the folders "root" and the manufacturer "Volkswagen".

The design depends on your CSS.

# Tree view in depth

## Based on the jQuery plugin jsTree

The frontend functionality is based on the jQuery plugin jsTree.

If you are using a filter with the type CATEGORY\_MENU in context with a table, which has a tree view, the TYPO3 Browser generates the tree view in the frontend automatically.

Automatically means: the Browser includes

- the JSS script jsTree
- an own script for controlling jsTree

jsTree has a lot of features.

### jsTree homepage

If you want to know more about jsTree, please refer to

- <http://www.jstree.com/>

## Cookies

The Browser provides jsTree supported by cookies. If a user has left a website with jsTree and visits it again, the tree view will have the same status like the last visit.

This is important in another context. If a user has selected an item of the tsTree and the page is loaded again, the tsTree isn't collapsed but has the previous status.

## Themes

### Provided themes

jsTree provides four themes by default:

- apple
- classic
- default
- default-rtl (rtl means right to left. Some languages will be written from right to left).

### Grüne Autos

Begriff suchen  Suche Zu

Illustration 32: Apple

### Grüne Autos

Begriff suchen  Suche Zu

Illustration 33: Classic

### Grüne Autos

Begriff suchen  Suche Zu

Illustration 34: Default

## Select a provided theme

You can select a provided theme by TypoScript. See property:

```
plugin.tx_browser_pi1.javascript.jquery.plugins.jstree.library.marker.theme.value = apple
```

## Own theme

You may design your own theme. Please refer to the homepage of jsTree (see above).

## More than one tree view

You can use the tree view unlimited. But only five tree views are prepared.

## Controlling by the HTML id

A tree view is controlled by the HTML id.

The browser has prepared five ids.

They are configurable by the TypoScript Constant Editor, because the ids are used in the TypoScript at several properties.

## TypoScript Object Browser

The screenshot shows the TYPO3 TypoScript Object Browser interface. The top navigation bar includes 'TypoScript Object Browser' and 'Path: /'. Below the navigation is a search bar and filter options ('Browse: Setup', 'Object List: ALL', 'Search:'). The main content area is titled 'SETUP ROOT' and displays a hierarchical tree of TypoScript properties. A red circle highlights a specific node under the 'filter' section of the 'list' configuration for a tree view.

```

[config]
[plugin]

```

Illustration 35: Tree view id property of a filter

If you use a second filter as a tree view menu, please move the html\_id from ...01 to ...02. See the snippet below.

```

plugin.tx_browser_pi1 {
    views.list.1.filter {
        your_table {
            your_field {
                treeview {
                    html_id {
                        value = {$plugin.tx_browser_pi1.jQuery.plugin.jstree.selector_02}
                    }
                }
            }
        }
    }
}
    
```

Same procedure for any other tree view. Please use

- ...03
- ...04
- ...05

If you aren't familiar with TypoScript constants, please refer to the paragraph below.

## TypoScript Constant Editor

**Template tools**

**Edit constants for template:**

**page\_organiser\_143 - (Organiser - TYPO3 für Veranstalter)**

Category: BROWSER - JQUERY (6)

**jstree theme** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.theme]  
Name of the theme of tree views  
apple

**selector 1** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.selector\_01]  
HTML id of div tag which contains a tree view  
tx-browser-pi1-jstree-01

**selector 2** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.selector\_02]  
HTML id of div tag which contains a tree view  
tx-browser-pi1-jstree-02

**selector 3** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.selector\_03]  
HTML id of div tag which contains a tree view  
tx-browser-pi1-jstree-03

**selector 4** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.selector\_04]  
HTML id of div tag which contains a tree view  
tx-browser-pi1-jstree-04

**selector 5** [plugin.tx\_browser\_pi1.jQuery.plugin.jstree.selector\_05]  
HTML id of div tag which contains a tree view  
tx-browser-pi1-jstree-05

Illustration 36: Tree view ids from 1 to 5

Usually there isn't any need to change an id for a tree view. If you have special needs for CSS, it is recommended to change the id supported by the TypoScript Constant Editor, but not by the TypoScript Object Browser.

## Disable the tree view

If you don't want to use the tree view in the frontend, you can disable it. The snippet is an example for a list with the number one and a filter with the table field tx\_greencars\_manufacturer.title.

It is recommended to display only the top level of the category table. You configure it with a SQL andWhere.

```
plugin.tx_browser_pi1 {
    views {
        list {
            1 {
                filter {
                    tx_greencars_manufacturer {
                        // Disable the tree view
                        title.treeview.enabled.value = 0
                        // Enable top level only
                        sql.andWhere = tx_greencars_manufacturer.uid_parent = 0
                    }
                }
            }
        }
    }
}
```

Illustration 38: Disabled tree view with top level only

## How to add an own script?

The Browser adds a short JSS script for controlling the jsTree plugin.

If there is any need to use an own script, please configure the array:

```
plugin.tx_browser_pil {
    javascript {
        plugins {
            jstree {
                ...
            }
        }
    }
}
```

## Use marker in your script

If you are using an own script, there will be the need to replace marker while runtime too. You can replace any marker in your JSS script. See the marker section in

```
plugin.tx_browser_pil.javascript.jquery.plugins.jstree.library.marker
```

Every marker is a COA. For example: the TypoScript marker "your\_marker" will replace the string #####YOUR\_MARKER##### in your JSS file.

## Restrictions

### Five tree view per page are applicabeld

The TYPO3 Browser is applicabeld for five tree views per page.

Applicabeld means:

- TypoScript is prepared
- jQuery is prepared

If you like to use more than five tree views per page, you have to extend TypoScript and jQuery. But sorry: this isn't part of this tutorial.

### More than one tree view per page

You have to take care for the id of the div wrap of the tree view by your own. You have to update or extend the CSS for the jstree id.

### No path is calculated

You have to allocate an item to the category, each node and the root.

Example:

You have a database with cars and a category tree like

- manufacturer [root]
  - model [node]
    - car parts [category]

You like to categories a rear brake for a Volkswagen Golf V.

You have to allocate the item to the root, each node and the category:

- Volkswagen [id 37]
  - Golf V [id 1423]
    - breaks [id 23412]

The parent uid field of the item must contain the ids 37, 1423, 23412 (the order is unimportant and it hasn't any effect for the frontend).

### Performance

This restriction is caused because of performance.

The Browser is able to filter all records of the database with one SQL query only.

Without all ids of the category path, it would be a need, to calculate the category path for each record while runtime. You will need a SQL query for each record in a worst case: If you have 16.000 records, you will have 16.000 SQL queries.

## More examples

### Quick Shop - 1 Filter

It is very simple to configure the content objects

- SELECTBOX
- CHECKBOX and
- RADIOBUTTONS

All have a master template. You copy the master template to your view and you configure the properties only, which aren't configured for your needs.

If you are interested in the power of a master template, please look at

- Reference 'SELECTBOX' on page 49 below

After copying you will see the powerful TypoScript code supported by the TypoScript Object Browser in your view array. It should be comprehensible, how to change any feature and property of your filter to your needs.

See section

- 'TypoScript Object Browser' on page 17 above and
- Reference 'master\_templates' on page 47 below

See the examples below.

### SELECTBOX

## Quick Shop

The screenshot shows a TYPO3 Quick Shop interface. At the top, there is a search bar with 'Begriff suchen' and a dropdown menu 'Produkt'. Below the search bar, there is a 'Kategorie wählen' dropdown menu with categories: Becher (1), Bücher (1), Kleidung (4). To the right of the dropdown is a 'Begriff suchen' input field and a 'Suche' button. Below the categories, there is a horizontal navigation bar with letters M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z. Underneath the navigation bar, it says '1 von 3 von insgesamt 6 Datensätzen'. At the bottom left, there is a pagination control with '«« < 1-3 4-6 > »»»'.

**Pullover**  
Rot mit TYPO3 Kopf.

See the TypoScript on the next page.

## TypeScript

See the line

- // The filter becomes the property SELECTBOX

below in the snippet

```
plugin.tx_browser_pi1 {
    ...
    views {
        list {
            1 {
                select = ...
                filter {
                    tx_quickshop_categories {
                        // The filter becomes the property SELECTBOX
                        title < plugin.tx_browser_pi1.displayList.master_templates.selectbox
                        title {
                            // Configuration SELECTBOX begin
                            first_item {
                                stdWrap {
                                    data >
                                    value = Select a Category
                                    lang {
                                        de = Kategorie wählen
                                    }
                                }
                            }
                            wrap = <span class="selectbox">|</span>
                            wrap {
                                item {
                                    stdWrap {
                                        crop = 60 | ... | 1
                                    }
                                }
                            }
                            // Configuration SELECTBOX end
                        }
                    }
                }
            }
        }
        single {
            ...
        }
    }
}
```

Easy way of configuring: See section 'TypoScript Object Browser' on page 17 above.

                ...
                filter {
                    tx_quickshop_categories {
                        // The filter becomes the property RADIOBUTTONS
                        title < plugin.tx_browser_pil.displayList.master_templates.radiobuttons
                    }
                }
            }
        }
    }
}
```

## Green Cars - Dynamic Filter

The Browser filters are dynamically by default. This means:

- If a filter item hasn't any hit, it won't be displayed.
- Each filter controls all others..

### Exercise

We will change some TypoScript of the page <http://gruene-autos.org/> for demonstration only.

See the examples below.

### SELECTBOX (Default)

#### Grüne Autos

Begriff suchen  Suche Zurücksetzen  
 Typ  Antrieb  Preisgruppe   
 Hersteller

Illustration 42: Green Cars with three selectboxes - each with size = 1

This is the start page of <http://gruene-autos.org/>

It has three filters designed as selectboxes. Each displays one item only (HTML property size is 1).

The TypoScript for the three selectboxes should be clear (see the snippet below).

### TypoScript

See the lines

- // This filter becomes the property SELECTBOX  
below in the snippet

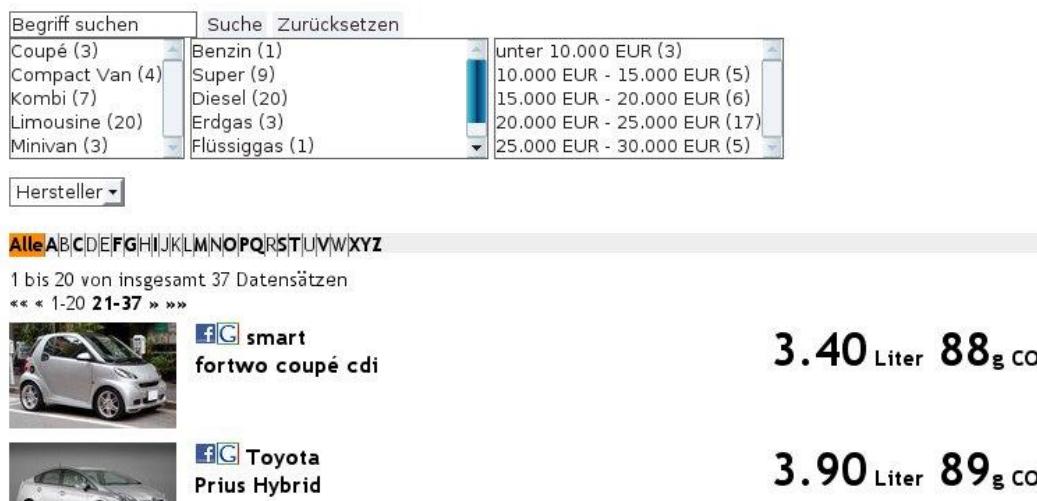

```
plugin.tx_browser_pi1 {
    ...
    views {
        list {
            1 {
                select = ...
                filter {
                    tx_greencars_engine {
                        // This filter becomes the property SELECTBOX
                        title < plugin.tx_browser_pi1.displayList.master_templates.selectbox
                        title {
                            first_item {
                                stdWrap {
                                    data = LLL:EXT:green_cars/locallang_db.xml:tx_greencars_main.engine
                                }
                            }
                            wrap = |
                        }
                    }
                    tx_greencars_pricebracket {
                        // This filter becomes the property SELECTBOX
                        title < plugin.tx_browser_pi1.displayList.master_templates.selectbox
                    }
                }
            }
        }
    }
}
```

```
title {
    first_item {
        stdWrap {
            data = LLL:EXT:green_cars/locallang_db.xml:tx_greencars_main.pricebracket
        }
    }
    wrap = |
    order {
        field = uid
    }
}
tx_greencars_type {
// This filter becomes the property SELECTBOX
title < plugin.tx_browser_pi1.displayList.master_templates.selectbox
title {
    first_item {
        stdWrap {
            data = LLL:EXT:green_cars/locallang_db.xml:tx_greencars_main.type
        }
    }
    wrap = |
}
}
```

## SELECTBOXES size = 5

For a better understanding of dynamic filters we change the properties of each selectbox. We like to display five items per box and we remove the title (the first item). See the illustration below.

### Grüne Autos

The screenshot shows the TYPO3 backend search interface for 'Grüne Autos'. At the top, there's a search bar and a menu bar with 'Suche' and 'Zurücksetzen'. Below the search bar are three dropdown filters:

- tx\_greencars\_engine**: Options: Benzin (1), Super (9), Diesel (20), Erdgas (3), Flüssiggas (1).
- tx\_greencars\_pricebracket**: Options: unter 10.000 EUR (3), 10.000 EUR - 15.000 EUR (5), 15.000 EUR - 20.000 EUR (6), 20.000 EUR - 25.000 EUR (17), 25.000 EUR - 30.000 EUR (5).
- tx\_greencars\_type**: Options: Coupé (3), Compact Van (4), Kombi (7), Limousine (20), Minivan (3).

Below the filters, there's a 'Hersteller' dropdown menu, a navigation bar with letters A-Z, and a message indicating 1 bis 20 von insgesamt 37 Datensätzen. Two car entries are shown at the bottom:

- smart fortwo coupé cdi**: Fuel consumption 3.40 Liter, CO<sub>2</sub> emissions 88 g CO<sub>2</sub>.
- Toyota Prius Hybrid**: Fuel consumption 3.90 Liter, CO<sub>2</sub> emissions 89 g CO<sub>2</sub>.

Illustration 43: Green Cars with three selectboxes - each with size = 1

### TypeScript

```
// Set the size of all boxes to 5
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_engine.title.size = 5
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_pricebracket.title.size = 5
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_type.title.size = 5
// Don't display the first_item
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_engine.title.first_item = 0
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_pricebracket.title.first_item = 0
plugin.tx_browser_pi1.views.list.1.filter.tx_greencars_type.title.first_item = 0
```

### Selection Case

We are interested in cars

- with a diesel or domestic gas engine
- with a price-bracket from 20.000 EUR to 25.000 EUR

## Grüne Autos

Begriff suchen  Suche Zurücksetzen

Coupé (3)	Benzin (1)	unter 10.000 EUR (3)
Compact Van (4)	Super (9)	10.000 EUR - 15.000 EUR (5)
Kombi (7)	Diesel (20)	15.000 EUR - 20.000 EUR (6)
Limousine (20)	Erdgas (3)	20.000 EUR - 25.000 EUR (17)
Minivan (3)	Flüssiggas (1)	25.000 EUR - 30.000 EUR (5)

Illustration 44: Green Cars with three selectboxes - each with size = 1

If you like, that the values in the boxes will changed after sending the form, please setting up in the flexform in the tab [List view] the field "Total hits" to [Controlled by selected filters].

You will have this behaviour:

- every item has a new number of hits
- there are some items without any hit and they won't be displayed like
  - Coupe
  - all engines without a selection (of course)
  - all price-brackets without a selection (of course)

Illustration 45: Green Cars with three selectboxes - each with size = 1

## Change the Behavior

Display price-brackets even if they haven't any hit

### Grüne Autos

The screenshot shows a search interface for green cars. At the top, there are three dropdown menus: 'Begriff suchen' (Search term), 'Suche' (Search), and 'Zurücksetzen' (Reset). Below these are two dropdown menus: 'Compact Van (1)' and 'Diesel (12)'. The 'Diesel (12)' menu has several options: 'unter 10.000 EUR (0)', '10.000 EUR - 15.000 EUR (1)', '15.000 EUR - 20.000 EUR (0)', '20.000 EUR - 25.000 EUR (13)', and '25.000 EUR - 30.000 EUR (0)'. The '20.000 EUR - 25.000 EUR (13)' option is highlighted. Below the dropdowns is a 'Hersteller' (Manufacturer) dropdown with 'Alle' selected. A navigation bar below it includes links from 'Alle' to 'A|B|C|D|E|F|G|H|I|J|K|L|M|N|O|P|Q|R|S|T|U|V|W|XYZ'. The main content area displays two car models: a silver Volkswagen Golf 1.6 TDI BlueMotion and a blue Volvo S40 1.6 D DRIVe Start/Stop. Each car is shown with its manufacturer logo, model name, and fuel efficiency information: '3.80 Liter 99 g CO<sub>2</sub>' and '3.90 Liter 104 g CO<sub>2</sub>' respectively.

Illustration 46: Green Cars with three selectboxes - each with size = 1

### TypoScript

```
// Display price-brackets even if they haven't any hit
plugin.tx_browser_pil {
    views.list.1.filter.tx_greencars_pricebracket.title.wrap.item.display_without_any_hit = 1
}
```

Display price-brackets without the number of hits

### Grüne Autos

This screenshot is identical to Illustration 46, showing the same search interface and car listings. The key difference is in the TypoScript configuration, which now prevents the price brackets from displaying their hit counts.

Illustration 47: Green Cars with three selectboxes - each with size = 1

### TypoScript

```
// Display price-brackets without the number of hits
plugin.tx_browser_pil {
    views.list.1.filter.tx_greencars_pricebracket.title.wrap.item.display_hits = 0
}
```

## Organiser - Filter for a period (data area)

This is a typical example for a calendar.

This is the case:

- dates of events are stored in a field "datetime"
- the format of a date is a timestamp
- the table tx\_org\_cal contains the field datetime. The table.field-syntax is: tx\_org\_cal.datetime

### Preconditions

We have configured a list view (and a single view of course) for the table tx\_org\_cal.

### HTML Template

We have added the marker `###TX_ORG_CAL.DATETIME###` to our HTML template into the filter section.

See section [HTML Template](#) on page 15 above.

### TypoScript Snippet SELECTBOX

```

1. plugin.tx_browser_pil {
2.   views {
3.     list {
4.       201 {
5.         name    = Calendar
6.         select (
7.           tx_org_cal.title,
8.           tx_org_cal.datetime
9.         )
10.        csvLinkToSingleView = tx_org_cal.title
11.        filter {
12.          tx_org_cal {
13.            datetime < plugin.tx_browser_pil.displayList.master_templates.selectbox
14.          }
15.        }
16.      }
17.    }
18.  ...
19. }
20. }
```

### Result in the Frontend

Illustration 48: Calendar with select box

### Comment

Line 11 to 13 (see page above): we allocates a filter for tx\_org\_cal.datetime in form of a SELECTBOX.

The items of the SELECTBOX are in our case:

```
<option value="1283968800">1283968800 (2)</option>
<option value="1304892000">1304892000 (1)</option>
```

```
<option value="1315591200">1315591200 (3)</option>
```

This means:

- We have two dates at 1283968800, one date at ... and three dates at ...

But we don't want for every date an item in the selectbox. We want something like "Display the events of the last year, this year and the next year".

We want something like this:

```
<option value="10">2009 (0)</option>
<option value="20">2010 (2)</option>
<option value="30">2011 (4)</option>
```

We add an area out of the master template section and configure some properties.

## TypoScript Snippet with Area

```
1. plugin.tx_browser_pil {
2.   views {
3.     list {
4.       201 {
5.         name    = Calendar
6.         select (
7.           tx_org_cal.title,
8.           tx_org_cal.datetime
9.         )
10.        csvLinkToSingleView = tx_org_cal.title
11.        filter {
12.          tx_org_cal {
13.            datetime < plugin.tx_browser_pil.displayList.master_templates.selectbox
14.            datetime {
15.              // Every item should be displayed even though it hasn't any hit
16.              wrap.item.display_without_any_hit = 1
17.              // Order the items by uid (and not by value)
18.              order.field = uid
19.              // Allocates the master template sample_period
20.              area < plugin.tx_browser_pil.displayList.master_templates.areas.sample_period
21.            }
22.          }
23.        }
24.      }
25.    }
26.    ...
27.  }
28. }
```

### Comment

Line 16: Every item should be displayed even though it hasn't any hit

Line 18: Order the items by uid (and not by value)

Line 20: This is the most important line. We allocate the master template sample\_period.

This template provides by default:

- a period of years
- a period from last year to next year (be aware of the relative period!)
- and the items are formatted as year only.

Every property is configurable.

We get, what we want:

```
<option value="10">2009 (0)</option>
<option value="20">2010 (2)</option>
<option value="30">2011 (4)</option>
```

## Properties and Possibilities

Please refer to the Reference AREAS on page 52 below.

## Condition for a Filter

Each filter has the property condition. condition is a cObject. By default the condition is met.

### TypoScript Default Code

```
// If condition is met, filter will display. If not, filter will hide.
condition = TEXT
condition {
    // True (default)
    value = 1
}
```

### Example

The extension Organiser (extKey: org) provide documents for downloading. There are two steps for selecting an document:

1. The visitor has to select a category before viewing a list
2. The list has a category filter, but it shouldn't displayed if a category was selected before

We configure the condition like in the TypoScript snippet below:

- Line 11-12: We remove the default condition property and define a new condition property as a COA
- Line 14-31: The COA has two elements. Both elements have an if property.  
The if property checks if there is the global parameter tx\_browser\_pi1[tx\_org\_downloadscat.title][0].  
. This parameter will sent, if a category is selected.  
If a category is selected (if.isTrue), the COA will return 0, any filter won't display.  
If any category is selected (if.isFalse), the COA will return 1, the filter will display.

### TypoScript Snippet

```
1. plugin.tx_browser_pi1 {
2.     views {
3.         list {
4.             301 = +Org: Downloads
5.             301 {
6.                 ...
7.                 filter {
8.                     tx_org_downloadscat {
9.                         title < plugin.tx_browser_pi1.displayList.master_templates.selectbox
10.                        title {
11.                            condition >
12.                            condition = COA
13.                            condition {
14.                                10 = TEXT
15.                                10 {
16.                                    value = 0
17.                                    if {
18.                                        ifTrue {
19.                                            data = GPvar:tx_browser_pi1|tx_org_downloadscat.title|0
20.                                        }
21.                                    }
22.                                }
23.                                20 = TEXT
24.                                20 {
25.                                    value = 0
26.                                }
27.                            }
28.                        }
29.                    }
30.                }
31.            }
32.        }
33.    }
34.}
```

```
26.         if {
27.             isFalse {
28.                 data = GPvar:tx_browser_pi1|tx_org_downloadscat.title|0
29.             }
30.         }
31.     }
32. ...
33. ...
```

# Configuring hits

## The difference between counting and displaying

The Browser is counting hits and display it.

The display is depending on counting of course.

If you have configured, that items without any hit will displayed and you disable the counting of hits, no filter won't displayed!

### Disable counting

If you have a lot of data and a lot of category tables with a lot of items, the counting of hits can cost performance.<sup>1</sup>

You can disable and enable the counting of hits per each filter in the TypoScript. See the example below.

```
plugin.tx_browser_pil {
    views.list.1.filter.table.field {
        count_hits = 0
    }
}
```

*table.field:* table is the category table like tt\_news\_cat and field the label field like title.

### All filter items will displayed by default

If counting is disabled, all filter items will displayed by default. Each filter has the property

```
wrap.item.displayInCaseOfNoCounting
```

If this property is enabled, each filter row get a flag. You can disable this behaviour. Set displayInCaseOfNoCounting to 0.

```
plugin.tx_browser_pil {
    views.list.1.filter.table.field {
        count_hits = 0
        ...
        wrap {
            item {
                displayInCaseOfNoCounting = 0
            }
        }
    }
}
```

---

<sup>1</sup> If you want to know more about performance, you can enable the DRS performance report in the extension manager.

# cObject

From Browser version 4 filter have the cObject property:

```
// cObject for the first filter item
filter.tx_greencars_engine.title.first_item.cObject
// cObject for filter items
filter.tx_greencars_engine.title.wrap.item.cObject
```

TYPO3 integrators are more flexible now.

## Display conditions for a filter item

The cObject has an if property with three OR conditions by default.

A filter item will displayed:

1. if it has one hit at least or
2. if counting is disabled (see "Disable counting" on page 43 above) or
3. if the current filter is a treeview

```
plugin.tx_browser_pi1 {
    views.list.1.filter.table.field {
        ...
        wrap {
            item {
                cObject = COA
                cObject {
                    ...
                    if {
                       .isTrue {
                            // Display with hits only or in case of a tree view
                            cObject = COA
                            cObject {
                                10 = TEXT
                                10 {
                                    field = hits
                                }
                                20 = TEXT
                                20 {
                                    field = tx_browser_pi1.flag_displayInCaseOfNoCounting
                                }
                                30 = TEXT
                                30 {
                                    field = tx_browser_pi1.flag_treeview
                                }
                            }
                        }
                    }
                    wrap = <a href="#URL##"##CLASS#####STYLE#####TITLE##>|</a>
                }
            }
        }
    }
}
```

You can disable it: remove if.isTrue.cObject.10 or 20 or 30 or all.

## The "no value" label

The cObject has the two elements 20 and 21 by default.

cObject.20 will displayed, if there is an value.

cObject.21 will displayed, if there isn't any value.

```
plugin.tx_browser_pi1 {
    views.list.1.filter.table.field {
        ...
        wrap {
            item {
                cObject = COA
                cObject {
                    // Value in case of a value
                    20 = TEXT
                }
            }
        }
    }
}
```

```
20 {
    if {
        isTrue {
            field = value
        }
    }
    field = value
    htmlSpecialChars = 1
    crop = 60 | ... | 1
}
// Value in case of no value
21 = TEXT
21 {
    if {
        isTrue {
            field = value
        }
        negate = 1
    }
    data = LLL:EXT:browser/pil/locallang.xml:label_categorymenu_noValue
}
}
}
}
```

## Replace values

TYPO3 integrators are able, to replace special values. This could be an example: replace Audi, Seat and Skoda with "VW Group".

You have to configure a TEXT object with the proper if. But this isn't part of this tutorial.

## Configure or disable hits

If an item has one hit at least, it will be extended with something like "(4)" in case of four hits. If you want to disable or change it, please edit cObject.30.

```
plugin.tx_browser_pil {
    views.list.1.filter.table {
        ...
        wrap {
            item {
                cObject = COA
                cObject {
                    ...
                    // Hits
                    30 = TEXT
                    30 {
                        if {
                            // Display hits only in case of one hit at least
                            isTrue {
                                field = hits
                            }
                        }
                        field = hits
                        noTrimWrap = | ()|
                    }
                }
            }
        }
    }
}
```

If you like to prepend the hit result for example, please move cObject.30 to cObject.10.

# Reference

This tutorial provides only the reference for the master\_template array (see below)

You find all other stuff in the manual of the Browser:

- HTML <http://typo3.org/documentation/document-library/extension-manuals/browser/current/>
- PDF: [http://typo3.org/extensions/repository/view/browser/current/info/?tx\\_terfe\\_pi1%5BdownloadFile%5D=doc%252Fmanual.pdf](http://typo3.org/extensions/repository/view/browser/current/info/?tx_terfe_pi1%5BdownloadFile%5D=doc%252Fmanual.pdf)

## master\_templates

All master\_templates are local. You have to copy the template to your view and configure it there.

See the example below.

Property:	Data type:	Description:	Default:
master_templates	array	<p>Configuration of master templates for the filter.</p> <p>Content Objects are</p> <ul style="list-style-type: none"> <li>• CATEGORY_MENU</li> <li>• CHECKBOX</li> <li>• RADIOBUTTON</li> <li>• SELECTBOX</li> </ul> <p><b>Code:</b></p> <pre>plugin.tx_browser_pi1 {     displayList {         master_templates {             selectbox = SELECTBOX             selectbox {                 ...             }         }     } }</pre> <p><b>Example:</b></p> <pre>plugin.tx_browser_pi1 {     views {         list {             1 {                 select (                     fe_users.last_name,                     fe_users.first_name,                     fe_users.image,                     fe_groups.title,                     tx_org_management.title                 )                 filter {                     fe_groups {                         title &lt; plugin.tx_browser_pi1.\displayList.\master_templates.selectbox                         title {                             first_item {                                 stdWrap {                                     data &gt;                                     value = All Groups                                     lang.de = Alle Gruppen                                 }                             }                             wrap = \                                 &lt;span class="selectbox"&gt; &lt;/span&gt;                             wrap {                                 item {                                     stdWrap {   crop = 30   ...   1                                     }                                 }                             }                         }                     }                 }             }         }     } }</pre>	

## CATEGORY\_MENU

Display your filter as a HTML category menu.

The subpart ###CATEGORY\_MENU### is disabled by TypoScript by default. The subpart will removed from the HTML template - you won't have any waste in your code.

If you are using the category menu please enable in your global or local configuration:

```
displayList.display.category_menu = 1
```

Property:	Data type:	Description:	Default:
CATEGORY_MENU	array	Content Object CHECKBOX  <b>Example:</b> <a href="#">See Code of SELECTBOX below</a>	

## CHECKBOX

Display your filter as a HTML check box.

Property:	Data type:	Description:	Default:
CHECKBOX	array	Content Object CHECKBOX  <b>Example:</b> <a href="#">See Code of SELECTBOX below</a>	

## RADIOBUTTONS

Display your filter as HTML radio buttons.

Property:	Data type:	Description:	Default:
RADIOBUTONS	array	Content Object RADIOBUTONS  <b>Example:</b> <a href="#">See Code of SELECTBOX below</a>	

## SELECTBOX

Property:	Data type:	Description:	Default:
SELECTBOX	array	<p>Content Object SELECTBOX</p> <p><b>Example:</b> See Code below</p>	

```

plugin.tx_browser_pi1 {
    displayList {
        master_templates {
            selectbox = SELECTBOX
            selectbox {
                // If condition is met, filter will display. If not, filter will hide.
                condition = TEXT
                condition {
                    // True (default)
                    value = 1
                }
                // [String/optional] Name for the piVar. Name must be unique.
                nice_piVar =
                // [Boolean] Should be added a default item?
                first_item = 1
                first_item {
                    // [Boolean] 0: Item without any hit will not be displayed. 1: Any item will be displayed.
                    display_without_any_hit = 1
                    // [Boolean] 1: Items display the number of hits. 0: Items doesn't display any number of hits.
                    display_hits = 0
                    display_hits {
                        // [Boolean] 1: Hits are displayed behind the item. \
                        // 0: Hits are displayed in front of the item.
                        behindItem = 1
                        stdWrap {
                            noTrimWrap = |{()|}
                        }
                    }
                    stdWrap {
                        data = LLL:EXT:browser/pi1/locallang.xml:label_filter_firstitem_default
                    }
                    // [STRING, unique] Value attribute in the option tag (#11401)
                    option_value = 0
                }
                // [Boolean] Should it be possible to select more than one item?
                multiple = 0
                multiple {
                    // [String] HTML code for multiple
                    selected = multiple="multiple"
                }
                // [Integer] How many items should the select box display in the visible area?
                size = 1
                // [String] Wrap the object
                wrap = <div class="selectbox">###TITLE###</div>
                wrap {
                    // [Integer] Space characters from left margin in the HTML code
                    nice_html_spaceLeft = 12
                    title stdWrap {
                        // [String] Title of the object. If it shouldn't display, please delete the title array

                    }
                    // [String] Wrap one item
                    item = <option###CLASS#####STYLE### value="###UID###"###ITEM_SELECTED###">|</option>
                    item {
                        // [Boolean] 0: Item without any hit will not be displayed. 1: Any item will be displayed.
                        display_without_any_hit = 0
                        // [Boolean] 1: Items display the number of hits.\ \
                        // 0: Items doesn't display any number of hits.
                        display_hits = 1
                        display_hits {

```

```
// [Boolean] 1: Hits are displayed behind the item. \
//          0: Hits are displayed in front of the item.
behindItem = 1
stdWrap {
    noTrimWrap = | (|) |
}
// [Integer] Space characters from left margin in the HTML code
nice_html_spaceLeft = 16
// [String] HTML code for a selected item
selected = selected="selected"
// [String] Default HTML class
class =
// [String] Default HTML style
style =
stdWrap {
    htmlSpecialChars = 1
    crop           = 60 | ... | 1
}
}
order {
    // [String] value || uid
    field = value
    // [String] ASC || DESC
    orderFlag = ASC
}
sql {
    // [String, SQL] And where statement. Example: \
        tt_news_cat.author.field LIKE 'A%' AND tt_news.uid < 99
    andWhere =
}
// [BOOLEAN] You have to allocate one of the areas of the master template.
area = 0
}
}
}
```

## filter condition

Property:	Data type:	Description:	Default:
filter.table.field.condition	cObject	<p>Define a condition for displaying or hiding your Browser plugin.</p> <p><b>Examples:</b></p> <ul style="list-style-type: none"><li>• See "Condition for a Filter" on page 41 above</li><li>• See Code below</li></ul>	

```
plugin.tx_browser_pil {
    views {
        list {
            1 {
                filter {
                    your_table {
                        your_field < plugin.tx_browser_pil.displayList.master_templates.selectbox
                        your_field {
                            // Remove the default condition
                            condition >
                                // Define your own condition
                            condition = COA
                            condition {
                                // See "Condition for a Filter" on page 41 above
```

## AREAS

Areas contains master templates for area samples. Samples are

- currency
  - hard coded
- period
  - hard coded
  - relative

### Areas are limited to integers and numbers.

We intend to extend it for chars and strings too<sup>1</sup>.

You need a content object SELECTBOX, CHECKBOX or RADIOPUSHONS from above, if you like to use an area filter.

Property:	Data type:	Description:	Default:
areas	array	<p>Configuration array for an area. You need it, if you like to filter data areas</p> <p><b>Default code:</b></p> <pre>plugin.tx_browser_pi1 {   displayList {     master_templates {       areas {         sample_currency = 1         sample_currency {           strings = 1           strings {             // Configuration for a hard coded             // currency area           }         }         sample_period = 1         sample_period {           strings = 0           strings {             // Configuration for a hard coded             // period           }           interval = 1           interval {             // Configuration for a relative period           }         }       }     } }</pre>	

### Example

Please refer to the section Organiser - Filter for a period (data area) on page above.

### TypoScript Object Browser

Please use the TypoScript Object Browser, if you like to inspecting all properties.

### Possibilities

See examples below.

---

<sup>1</sup> We like a contract. Do you know someone for contracting?

## AREA - Period interval

Period interval is a smart tool: Period interval enables you to define relative periods like

- display all seven days of the current week
- display four weeks from one week ago
- display all months of the current year
- display all years from last year to next year

If you want to play with the examples, please change the case property like this:

```
plugin.tx_browser_pi1.displayList.master_templates.areas {
    sample_period.interval.case = week
}
```

Property:	Data type:	Description:	Default:
areas	array	<p>Configuration array for an area. You need it, if you like to filter data areas</p> <p><b>Default code:</b></p> <pre>plugin.tx_browser_pi1 {     displayList {         master_templates {             areas {                 sample_period = 1                 sample_period {                     interval = 1                     interval {                         // [BOOLEAN]: 1: dates are converted to\                         timestamp. 0: undefined                         compare_wiTimeStamp = 1                         // [STRING] day, week, month, year                         case = year                         day {                             // Configuration for days                         }                         week {                             // Configuration for weeks                         }                         month {                             // Configuration for months                         }                         year {                             // Configuration for years                         }                     }                 }             }         }     } }</pre>	

### Day

See year below.

### Week

See year below.

### Month

See year below.

## Year

Every period has the properties:

- start\_period
- times\_stdWrap
- value\_stdWrap

Please inspect the TypoScript snippet below too become familiar with the properties and possibilities.

```
year {
    start_period {
        // [BOOLEAN] 1: Value is handled after stdWrap with php strtotime. 0: stdWrap only.
        use_php strtotime = 1
        stdWrap {
            // Examples with strtotime: -1 year, 2010, now, next year
            value = -1 year
        }
    }
    times_stdWrap {
        // [INTEGER] Display the period n times
        value = 3
    }
    value_stdWrap {
        // [STRING] Leave it empty! It will be handled while runtime.
        value =
        // [STRING] See php method strftime
        strftime = %Y
    }
    get_param {
        // PHP date format: Please use numbers only! Y example: 2011
        date_format = Y
    }
}
```

## Example

Please refer to the section **Organiser - Filter for a period (data area)** on page above.

## AREA - Period hard coded

It is possible to "hard code" a period too. See the example in

```
plugin.tx_browser_pi1.displayList.master_templates.areas {
    sample_period.string {
        ...
    }
}
```

## AREA - Currency hard coded

It is possible to "hard code" an area of numbers too. See the example in

```
plugin.tx_browser_pi1.displayList.master_templates.areas {
    sample_currency.string {
        ...
    }
}
```

# What's new in Version 4.0?

## Filter: cObject

[3.9.16]

Filters are a cObject. See "cObject" on page 44 above.

## Filter: conditions

[3.9.3]

You can define a display condition for a filter.

### Example for a requirement

You have the work flow:

- The visitor has to select a category before viewing a list
- The list shouldn't contain the category filter, if a category was selected before

See "Condition for a Filter" on page 41 above.

## Filter: tree view

[3.9.6]

You can display a category menu as tree view.

You need the extension cps\_tcatree. This extension enables to order items in a tree view.

See "Tutorial tree view" on page 18 above.

# What's new in Version 3.6?

## Area and interval: get parameters with date

[3.6.4]

Links of this menu "Calendar | March | April" will be now:

- <http://hfs.die-netzmacher.de/kalender/month/201103/>
- <http://hfs.die-netzmacher.de/kalender/month/201104/>

See reference:

- `get_param.date_format`

## Category Menu

[3.6.0]

You can filter your data by a category menu. The difference between a category menu and the available filters check box, radio buttons and select box is, that the first is a list of links and all others are a part of an HTML form.

You can use areas for a category menu in the same way like for filters.

## Configurable: Search respects Filters

[3.6.0]

It is configurable, if the search respect filters. It is possible to differentiate between every filter.

The new TypoScript property is

```
plugin.tx_browser_pi1.displayList.display.searchform.respect_filters
```

## Filter for areas

[3.6.0]

You can filter your data by areas. Example for areas are

- 2010 to 2012
- 10.000 EUR to 20.000 EUR

You can generate filter for periods relative like:

- all days of the current week
- -2 weeks from now to +2 weeks from now

## Filter for local table

[3.6.0]

You can filter data from the local table. Before version 3.6.0 it was possible to filter data of foreign tables only.

# Helpful suggestions

## Forum

The Browser has its own forum. We speak English and German.

You are welcome to post any question, bug or snippet code at

- TYPO3-Frontend-Engine Browser: Forum  
<http://typo3-browser-forum.de/>

The screenshot shows the TYPO3-Frontend-Engine Browser Forum interface. The main content area displays a list of forum topics. One topic is highlighted: "Was ist eigentlich ein Browser? Ich weiß nicht mehr... - TYPO3-Browser-Foru...". Below this, another topic is visible: "Dankeschön für den WEC! Ich kann jetzt auch wieder mit dem Browser arbeiten - TYPO3-Browser-Foru...". The sidebar on the right contains links for 'Startseite', 'Login / Logout', 'Referenzen', 'Über das Webdesign', 'Browser-Tutorials', 'RSS-Feed', 'Anhören an i-Tunes', 'Folge typo3.org', and 'Impressum'.
