

TYPO3 v9 LTS – What's New

The most important
new features, changes and improvements in 66 slides

Introduction

Key facts and figures

Introduction

TYPO3 v9 LTS

- Release date: 2 October 2018
- Release type: LTS release (Long Term Release)
- Development time: 18 months

Introduction

System Requirements

- PHP version 7.2+
- Required PHP settings:
 - `memory_limit` \geq 256M
 - `max_execution_time` \geq 240s
 - `max_input_vars` \geq 1500
 - compilation option `--disable-ipv6` must not be used
- Required PHP extensions:
filter, hash, openssl, pcre \geq 8.38, session, SPL, standard, xml, zip and zlib

Introduction

System Requirements

- Webserver such as Apache, Nginx, IIS, etc.
- All databases supported by **Doctrine DBAL** are also supported by TYPO3. For example:

- Minimum disk space required: 200 MB
- The backend requires Microsoft Internet Explorer 11 or later, Microsoft Edge, Google Chrome, Firefox, Safari or any other modern, compatible browser

Introduction

Development Timeline

Sprint Releases published:

- v9.0 12/Dec/2017 Install Tool and Page Tree Refactoring, Unified Page Translations
- v9.1 30/Jan/2018 Redirect Handling
- v9.2 10/Apr/2018 Site Handling
- v9.3 12/Jun/2018 SEO and URL Routing Preparations
- v9.4 04/Sep/2018 URL Routing for Pages
- v9.5 02/Oct/2018 LTS Preparation and Release

Introduction

Long Term Support

- TYPO3 version 9.5 is a LTS release (Long Term Support)
- Regular maintenance and bugfixes until March 2020
- Security and critical bugfixes until October 2021

Extended Support

[TYPO3 GmbH](#) offers Extended Long Term Support (ELTS) for TYPO3 v9 LTS until October 2024.

Page-based URL Handling

Speaking URLs "out of the box"

Page-based URL Handling

URL Segment

- New field "URL Segment" has been added to page properties
- All links generated in the backend and frontend use this field, if set
- Languages are taken into account automatically
- No need for third-party extensions to generate "speaking URLs"

Title

Page Title

URL Segment

Congrats, this page will look like <https://example.com/page-1/>

Page-based URL Handling

New TCA Field Type slug

- New TCA field type slug has been added
- Define parts of a URL path to generate and resolve URLs

```
'type' => 'slug',
'config' => [
    'generatorOptions' => [
        'fields' => ['title', 'nav_title'],
        'fieldSeparator' => '/',
        'prefixParentPageSlug' => true
    ]
    'fallbackCharacter' => '-',
    'eval' => 'uniqueInSite'
]
```

Page-based URL Handling

Routing Enhancers and Aspects

- Routes can be extended by "placeholders" to create URL paths such as:
`/path-to/my-page/products/{product-name}`
- This is done by "Enhancers" and "Aspects"
- TYPO3 v9 LTS supports the following enhancers out of the box:
 - Simple Enhancer (enhancer type "Simple")
 - Plugin Enhancer (enhancer type "Plugin")
 - Extbase Plugin Enhancer (enhancer type "Extbase")
- Configuration in file `config.yml` (no UI yet)
- Custom enhancers can be registered in `ext_localconf.php`:

```
$GLOBALS['TYPO3_CONF_VARS']['SYS']['routing']['CustomPlugin'] =  
    \MyVendor\MyPackage\Routing\CustomEnhancer::class;
```

Page-based URL Handling

Page Type Enhancer

- The `PageTypeEnhancer` lets you configure pages by type, e.g. ones with the suffix `.html`
- The suffix gets added at the very end of a URL by using the `StaticValueMapper`
- Configuration example:

```
routeEnhancers:  
  PageType:  
    type: PageType default: ''  
    map:  
      '.html': 1  
      'menu.json': 13
```

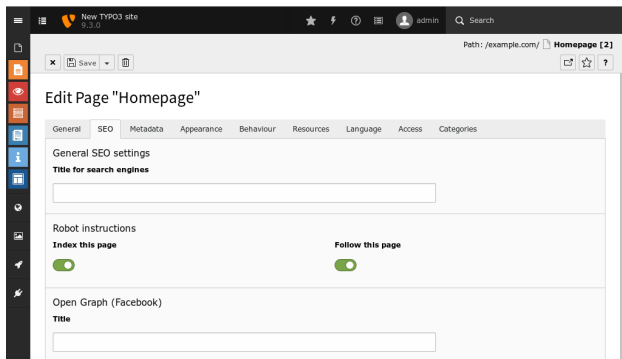

Search Engine Optimization

Now we can "SEO" you

Search Engine Optimization

Search Engine Optimization

Page properties feature a new "SEO" tab, which allows BE users to configure SEO-related information, [Open Graph](#) data and much more.

Search Engine Optimization

Search Engine Optimization (SEO)

- New [Page Title API](#) allows integrators and developers to influence what exactly is shown as the page title
- TYPO3 can generate [XML Sitemaps](#) now, with the capability to render different sitemaps per site and language
- Canonical links to pages are automatically added to prevent ranking penalties due to duplicate content for example
- In multi-language TYPO3 sites, hreflang-tags are added automatically
- SEO-related meta tags set in the page properties are now rendered in the frontend by default

Search Engine Optimization

Meta Tag Manager

- New **Meta Tag API** has been introduced to manage and render meta tags in a simple and flexible way
- TYPO3 core ships an **Open Graph** Meta Tag Manager, for example:

```
use \TYPO3\CMS\Core\MetaTag\MetaTagManagerRegistry;  
$metaTagManager = MetaTagManagerRegistry::getInstance()->getManagerForProperty('og:title');  
$metaTagManager->addProperty('og:title', 'This is the OG title from a controller');
```

- Functions available include:
 - `$metaTagManager->addProperty()`
 - `$metaTagManager->removeProperty()`
 - `$metaTagManager->removeAllProperties()`

Search Engine Optimization

Meta Tag Manager

- Developers can register custom MetaTagManager in the MetaTagManagerRegistry

```
use \TYPO3\CMS\Core\MetaTag\MetaTagManagerRegistry;
$metaTagManagerRegistry = MetaTagManagerRegistry::getInstance();
$metaTagManagerRegistry->registerManager(
    'custom',
    \Some\CustomExtension\MetaTag\CustomMetaTagManager::class
);
```

- Meta tags can be set by TypoScript and PHP

```
page.meta {
    og:site_name = TYPO3
    og:site_name.attribute = property
    og:site_name.replace = 1
}
```

("replace = 1" replaces earlier set meta tags)

Site Management

Have everything under control and in one central place

Site Management

Site Management

A new main module **Site Management** has been introduced. Configurations are stored in a YAML file under `typo3conf/sites/`

The first two default components are:

- Sites
- Redirects

Extensions can add further sub-modules as required.

Site Management

Site Management → Sites

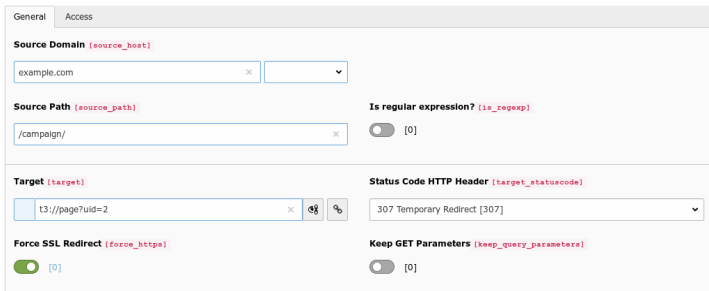

The main purpose is to store settings related to the configuration of a site, e.g. languages, domains, routing, error handling, etc.

General	Languages	Error Handling
Site Identifier <small>[identifier]</small> This name will be used to create the configuration directory. Mind the recommendations for directory names (only a-z,0-9,_,-) and make it unique. <input type="text" value="example-site"/>		
Root Page ID (You must create a page with a site root flag) <small>[rootPageId]</small> <input type="text" value="example.com [1]"/>		
Entry point (can be https://www.mydomain/ or just /, if it is just / you can not rely on TYPO3 creating full URLs) <small>[base]</small> Main URL to call the frontend in default language. <input type="text" value="https://example.com"/>		

Site Management

Site Management → Redirects

The **Redirects** module allows integrators and editors to configure redirects. The target can be a page, an external URL, a file, etc.

The screenshot shows the configuration interface for a redirect in TYPO3. It is divided into two tabs: 'General' and 'Access', with 'General' currently selected. The form contains several fields and controls:

- Source Domain** [source_host]: A text input field containing 'example.com' and a dropdown menu.
- Source Path** [source_path]: A text input field containing '/campaign/'.
- Is regular expression?** [is_regexp]: A toggle switch that is currently turned off, with a value of [0].
- Target** [target]: A text input field containing 't3://page?uid=2', accompanied by icons for external link and search.
- Status Code HTTP Header** [target_statuscode]: A dropdown menu showing '307 Temporary Redirect [307]'. The value [307] is also visible in the text below the dropdown.
- Force SSL Redirect** [force_https]: A toggle switch that is currently turned on, with a value of [0].
- Keep GET Parameters** [keep_query_parameter]: A toggle switch that is currently turned off, with a value of [0].

Site Management

Site Configuration in TypoScript

Site configuration can be accessed via `getText` property in TypoScript:

```
page.10 = TEXT
page.10.data = site:base
page.10.wrap = The base URL is: |
```

```
page.20 = TEXT
page.20.data = site:customConfigKey.nested.value
page.20.wrap = The nested value is: |
```

Backend User Interface

The TYPO3 administration interface is now better than ever

Backend User Interface

Page Tree

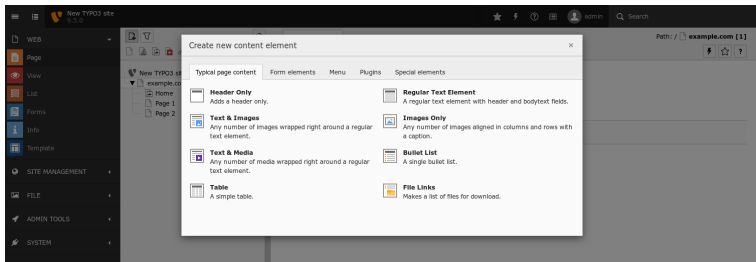

- Page tree is now based on SVGs and features superfast rendering times
- All ExtJS code has been removed completely from the TYPO3 backend
- Delete page by simply moving them to the right

Backend User Interface

Modal Windows

- TYPO3 now uses modal windows consistently in the backend
- This ensures a smooth and non-interruptive interaction with the system
- For example, when adding a new content element:

Backend User Interface

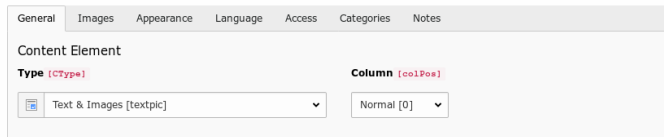

Duplicate Content Elements

- Button to duplicate a content element with a single mouse click
- Visibility can be configured in userTSConfig ("1" = enabled):

```
options.showDuplicate = 1  
options.showDuplicate.[table] = 1
```

Edit Page Content "Headline" on page "Page 1"

A screenshot of the TYPO3 content element configuration form. The form has a tabbed interface with tabs for "General", "Images", "Appearance", "Language", "Access", "Categories", and "Notes". The "General" tab is selected. Below the tabs, the text "Content Element" is displayed. There are two main fields: "Type [CType]" and "Column [colPos]". The "Type" field is a dropdown menu with "Text & Images [textpic]" selected. The "Column" field is a dropdown menu with "Normal [0]" selected.

Backend User Interface

Further Improvements

- Images are now rotated automatically on upload/edit, based on their orientation stored in the EXIF metadata of the image
- "Toggle switches" have been introduced, which are also a useful tool to allow users to switch between two states easily
- Thumbnail images are now loaded asynchronously (for example in the filelist)
- In debug mode, the field name of every FormEngine field is shown to admin users in the backend (see "In-Depth Changes" for an example)
- and many more...

Conditional Variants

New feature for form elements

Conditional Variants

Conditional Variants in `EXT:form`

- New feature for extension "Forms": *conditional variants*
- Variants can contain conditions and allow changing properties of a form element
- This makes it possible to manipulate form element values, validator and finisher options, etc. based on conditions

Conditional Variants

Conditional Variants in `EXT:form`

- Typical use cases are for example:
 - Translate form element values depending on the current frontend language
 - Set and remove validators depending on the value of another form element
 - Set finisher values depending on the value of a form element.
 - Hide a form element in certain finishers and on the summary page.
 - Hide entire pages in the workflow depending on the value of a form element.
 - and many more...
- [Official documentation](#) contains further details and examples

Admin Panel

An insight into the internal processes of TYPO3 at run-time

Admin Panel

Re-developed Admin Panel

The Admin Panel received a complete overhaul regarding its design as well as the underlying code and architecture.

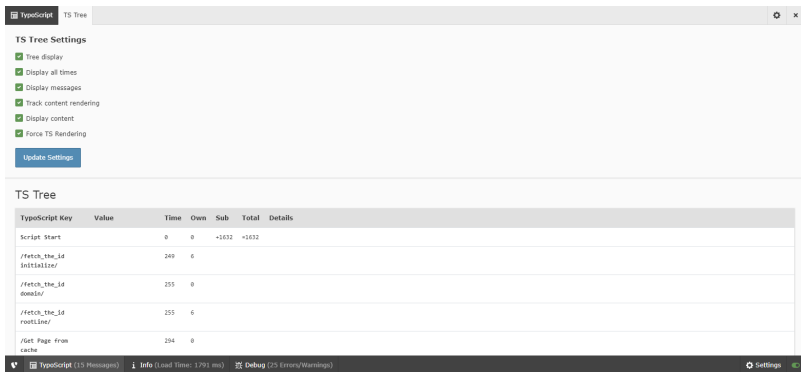

It is displayed at the bottom of a page in the frontend of TYPO3. The toggle button at the right allows integrators and editors to enable and disable the Admin Panel. The screenshot below shows the *enabled* state.

Admin Panel

Admin Panel: TypoScript Options

Example screenshot below shows TypoScript options.

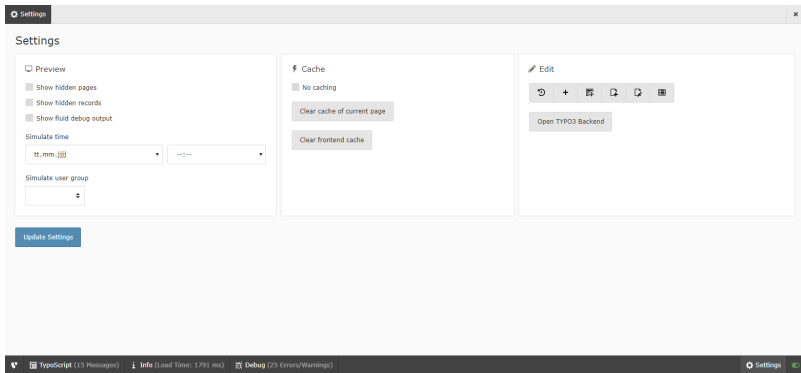

The screenshot displays the TypoScript Admin Panel interface. It features a 'TS Tree Settings' section with several checked options and an 'Update Settings' button. Below this is a 'TS Tree' section containing a table with columns for TypoScript Key, Value, Time, Own, Sub, Total, and Details. The table lists various TypoScript keys and their associated values and times.

TypoScript Key	Value	Time	Own	Sub	Total	Details
script start		0	0	+1632	+1632	
/fetch_the_id initialize/		249	0			
/fetch_the_id doneIn/		255	0			
/fetch_the_id rootLine/		255	0			
/Get Page from cache		294	0			

Admin Panel

Admin Panel: Configuration Options

Example screenshot below shows configuration options ("Settings").

The screenshot displays the 'Settings' configuration page in the TYPO3 Admin Panel. The interface is organized into three main columns:

- Preview:** Contains three checkboxes for 'Show hidden pages', 'Show hidden records', and 'Show fluid debug output'. Below these are two dropdown menus for 'Simulate time' (set to 'tt.mm.yyyy') and 'Simulate user group'.
- Cache:** Features a 'No caching' checkbox and two buttons: 'Clear cache of current page' and 'Clear frontend cache'.
- Edit:** Includes a toolbar with icons for undo, redo, and refresh, and a button labeled 'Open TYPO3 Backend'.

An 'Update Settings' button is located at the bottom left of the settings area. The bottom status bar shows 'TypoScript (15 Messages)', 'Info (Load Time: 1.791 ms)', 'Debug (25 Errors/Warnings)', and the active 'Settings' tab.

Privacy and Security

General Data Protection Regulation (GDPR) and more...

Privacy and Security

Anonymize IP Addresses

- Scheduler task can be activated to anonymize IP addresses in several database tables after a certain period of time
- For example table `sys_log`, after 30 days:

Scheduled tasks

	ID	Task	Type	Frequency	Parallel Execution	Last Execution	Next Execution	  	 
<input type="checkbox"/>	1	Anonymize IP addresses in database tables (scheduler) Table: sys_log after 30 days	Recurring	0 1 * * *	No	-	11-06-18 01:00		

- You can find more information on GDPR on the [TYPO3 GmbH Blog](#)

Privacy and Security

FE/BE User Accounts and Passwords

- Plain text passwords are not longer possible for BE/FE users at all
- Inactive FE/BE user records can now be removed from the database by adding scheduler task "Table garbage collection task" and enabling "Clean all available tables"

(data that does not exist, cannot be compromised in case of a security breach)

```
<?php
$tableGarbageCollectionTask = \TYPO3\CMS\Scheduler\Task\TableGarbageCollectionTask::class;
GLOBALS['TYPO3_CONF_VARS']['SC_OPTIONS']['scheduler']['tasks'][$tableGarbageCollectionTask]
    ['options']['tables'] = [
        'be_users' => [
            'dateField' => 'lastlogin',
            'expirePeriod' => 30
        ]
    ];
```

- See [documentation](#) for further details

Privacy and Security

No-cookie Domain for YouTube Videos

- YouTube videos are rendered by accessing the no-cookie domain <https://www.youtube-nocookie.com> by default
- The regular domain `www.youtube.com` can be forced by the following TypoScript configuration, if required:

```
lib.contentElement {
    settings {
        media {
            additionalConfig {
                no-cookie = 0
            }
        }
    }
}
```

Privacy and Security

Password Hashing API

- TYPO3 now uses the [PHP Password Hashing API](#), which features algorithms, such as [Argon2i](#) and [PBKDF2](#)

Hashing method for the frontend
basic.FE.saltedPWHashingMethod

PBKDF2 key derivation (advanced) ▼

Defines salted hashing method to use. Choose "Portable PHP password hashing" to stay compatible with other CMS (e.g. Drupal, Wordpress). Choose "MD5 salted hashing" to reuse TYPO3 passwords for OS level authentication (other servers could use TYPO3 passwords). Choose "Blowfish salted hashing" for advanced security to reuse passwords on OS level (Blowfish might not be supported on your system TODO).

Hashing method for the backend
basic.BE.saltedPWHashingMethod

PBKDF2 key derivation (advanced) ▼

- MD5 salted hashing (secure)
- Blowfish salted hashing (advanced)
- Portable PHP password hashing (phpass)
- PBKDF2 key derivation (advanced)
- Bcrypt password hashing (PHP native)
- Argon2i password hashing (PHP native)**

Privacy and Security

Password Hashing API

- Integrators can choose between several password hashing methods for FE and BE user passwords
- Given that MD5 is deemed highly insecure to protect passwords today, the support of MD5 hashes has been dropped
- If necessary, password hashes are automatically updated when users log in

In-depth Changes

Candy for Integrators and Developers

In-depth Changes

"Management" Database Columns

- Database schema analyzer automatically creates TYPO3 "management" columns by reading the TCA
- Developers do not need to state these fields in file `ext_tables.sql`
- Management fields are for example:
uid, pid, crdate, cruser, hidden, deleted, sortby, etc.
(also fields used for translations, versioning, workspaces)
- Field definitions in `ext_tables.sql` take precedence over automatically generated fields, which means they can be customized if required

In-depth Changes

Context API

- A new Context API was introduced in TYPO3 version 9.4
- The main goal of this concept is to centralize global variables
- The API aims to replace globally available objects (e.g. TSFE, sys_page, BE_USER, etc.) and to make them available in a common, structured and logical way
- Instead of exposing a full object (e.g. the BE_USER object), "aspects" contain properties, which are relevant and required only
- Extension developers can add aspects to the current context
- See [documentation](#) for further details and examples how to use the API

In-depth Changes

Feature Toggles

- You can now enable or disable core feature with a new function:
Feature Toggle (under ADMIN TOOLS → Settings)

Feature toggles ×

Enable and disable certain core features. Feature toggles in the core are used to globally use new features of TYPO3 that may be activated on new installations but upgrading installations can still use the old behaviour.

Available features:

- Off redirects.hitCount (default off): If on, and if extension "redirects" is loaded, each performed redirect is counted and last hit time is logged to the database.
- On unifiedPageTranslationHandling (default off): If on, TCA configuration for pages_language_overlay is never loaded and the database table "pages_language_overlay" is not created by core. Enable this feature if no extensions fiddles with table pages_language_overlay to have a slightly quicker system with less deprecation log entries.
- On TypoScript.strictSyntax (default on): If on, TypoScript is parsed in strict syntax modes. Enabling this feature means old condition syntax (which is deprecated) will trigger deprecation messages.
- Off simplifiedControllerActionDispatching (default off): If on, controller actions of backend modules and eID scripts do not receive a deprecated prepared response object as second argument. Enabling this feature slightly improves performance.

In-depth Changes

Feature Toggles

- The Feature Toggle lets developers implement features in parallel to their legacy version
- Integrators and site administrators can decide when they want to switch to new features
- Developers can leverage an API class
- This also means that the TYPO3 core and extensions can provide alternative functionality for a certain feature

In-depth Changes

Symfony ExpressionLanguage

- The [Symfony ExpressionLanguage](#) component has been implemented for TYPO3 conditions (frontend and backend)
- Some examples:

```
[page["uid"] in 18..45]
# This condition matches, if current page uid is between 18 and 45
[END]
```

```
[not ("foo" matches "/bar/")]
# This condition matches, if "foo" does not match the regular expression '/bar/'
[END]
```

```
[request.getNormalizedParams().getHttpHost() == 'example.com']
# This condition matches, if current hostname is 'example.com'
[END]
```

- Using old condition syntax triggers a deprecation message

In-depth Changes

Symfony ExpressionLanguage

- Expression Language can also be used in your custom code
- The TYPO3 core features the class `DefaultProvider`, which can be used directly (see example below) and custom implementations can extend the class `AbstractProvider`

```
use \TYPO3\CMS\Core\ExpressionLanguage\DefaultProvider;  
use \TYPO3\CMS\Core\ExpressionLanguage\Resolver;  
  
$provider = GeneralUtility::makeInstance(DefaultProvider::class);  
$conditionResolver = GeneralUtility::makeInstance(Resolver::class, $provider);  
$conditionResolver->evaluate('1 < 2'); // result is true
```

In-depth Changes

Install TYPO3 on SQLite

- TYPO3 now supports [SQLite](#), a self-contained, lightweight open source SQL database engine
- SQLite can be selected during the web-based installation process, if PHP module "pdo_sqlite" is installed and enabled:

Installing TYPO3 CMS

2 / 5 - 40% Complete

Select database

You will need to create a database user with the appropriate privileges to access your database.

Connection

Manually configured SQLite connection	▼
Manually configured MySQL TCP/IP connection	
Manually configured MySQL socket connection	
Manually configured SQLite connection	▶

In-depth Changes

Install TYPO3 on SQLite

- Database is stored in a single file, which means TYPO3 instances can now run natively in PHP, including the data storage
- Using SQLite makes sense for relatively small TYPO3 sites or e.g. for test and development instances
- System administrators should take appropriate actions to protect the `*.sqlite` file from unauthorized access if the file is stored inside the web container (depends on type of setup)

In-depth Changes

Field Names in Debug Mode

- TYPO3 integrators and developers often deal with input fields in the backend, e.g. when setting up access permissions or during TsConfig configuration
- Instead of having to look into the source code of the browser, field names are now displayed for each field generated by the FormEngine now
- This only applies to users with administrator privileges and requires that the debug mode is enabled in TYPO3:

```
$GLOBALS['TYPO3_CONF_VARS']['BE']['debug']
```

The screenshot shows a configuration interface for a 'Headlines' field. At the top, the label 'Headlines' is displayed. Below it, the field name 'Header' is shown with a red tooltip containing the text '[header]'. A large, empty text input field is positioned below the label. At the bottom of the configuration area, three settings are listed: 'Type' with a tooltip '[header_layout]', 'Alignment' with a tooltip '[header_position]', and 'Date' with a tooltip '[date]'.

In-depth Changes

Mail Queue

- Emails generated by TYPO3 are sent out immediately by default
- TYPO3 v9 LTS now supports [SwiftMailer's](#) spool functionality, where message are saved in a queue first and processed later
- Option 1: spool mails in memory
(emails are only sent, if request got executed without any exceptions or errors)

```
$GLOBALS['TYPO3_CONF_VARS']['MAIL']['transport_spool_type'] = 'memory';
```

- Option 2: spool mails in files

```
$GLOBALS['TYPO3_CONF_VARS']['MAIL']['transport_spool_type'] = 'file';  
$GLOBALS['TYPO3_CONF_VARS']['MAIL']['transport_spool_filepath'] = '/folder/of/choice';
```

In-depth Changes

Mail Queue

- The following console command can be used to process the queue and send out spooled emails

Process all spooled emails:

```
$ ./typo3/sysext/core/bin/typo3 swiftmailer:spool:send
```

Process spooled emails, but not more than 10 messages:

```
$ ./typo3/sysext/core/bin/typo3 swiftmailer:spool:send --message-limit=10
```

Process spooled emails, but no longer than 10 seconds:

```
$ ./typo3/sysext/core/bin/typo3 swiftmailer:spool:send --time-limit=10
```

In-depth Changes

Extension Scanner

- An Extension Scanner has been added to TYPO3 that aims to help when upgrading TYPO3 from one major version to the next
- This tool can scan extension code for the usage of TYPO3 core APIs which have been removed or marked deprecated
- The result is a detailed overview of actions required
- If available, it references to appropriate documentation on how to migrate the code in question
- Standalone tool [TYPO3 Scanner](#) (by Michiel Roos)
- Further details in a [video on YouTube](#) (by TYPO3 GmbH)

In-depth Changes

Extension Scanner (in TYPO3 v9 LTS)

Scan Extension Files ×

This module scans extensions for usage of deprecated and removed TYPO3 API calls. The module can be a great help for extension developers and site maintainers when upgrading to new core versions. However, the detection approach - based on static code analysis - is limited by concept: false positives/negatives are impossible to avoid. Further details can be found at [the official docs](#).

1 of 2 scanned

Scan all

Extensions

- Extension: `site_package`
- Extension: `styleguide` Checked 149 of 149 files
 - Classes/Controller/StyleguideController.php Fetch of property "content" weak
 - Classes/Controller/StyleguideController.php Fetch of property "content" weak

```
103: $generator->content = 123;
```

- Breaking: #55298 - Decoupled `sys_history` functionality** 9.0
- Deprecation: #84289 - Use `ServerRequestInterface` in `File/CreateFolderController`** 9.2

Effective lines of code: 8803
Files ignored by scanner: 0
Code lines ignored by scanner: 0

Rescan

Hand coded with ♥ by Michiel Roos

TYPO3Scan 1.3.0

Usage:
  command [options] [arguments]

Options:
  -h, --help            Display this help message
  -q, --quiet           Do not output any message
  -V, --version         Display this application version
  --ansi               Force ANSI output
  --no-ansi            Disable ANSI output
  -n, --no-interaction Do not ask any interactive question
  -v|vv|vvv, --verbose Increase the verbosity of messages: 1 for normal output, 2 for more verbose output and 3 for debug

Available commands:
  help Displays help for a command
  list Lists commands
  scan Scan a path for deprecated code

~/tmp >
```

In-depth Changes

Extbase Translation Handling

- Extbase now renders translated records the same way as TYPOScript does
- The new behaviour is controlled by the feature switch:

```
config.tx_extbase.features.consistentTranslationOverlayHandling  
    = 1
```

- The new behaviour is the default in v9 LTS (the feature switch will be removed in v10)
- Learn more about how to query data using Extbase in the [TYPO3 documentation](#)

In-depth Changes

PHP Standard Recommendation (PSR)

- The [PHP Standard Recommendation \(PSR\)](#) is a specification published by the PHP Framework Interop Group
- TYPO3 introduced PSR-15 middleware in the frontend and backend
- All web requests in the TYPO3 core return a response that complies with PSR-7, the standard for HTTP message interfaces
- The PSR-3 standard describes a logging interface for PHP applications, which is used by all logging procedures throughout the TYPO3 system now

Deprecated/Removed Functions

Deprecated/Removed Functions

To describe all deprecated/removed functions would go beyond the scope of this document.

Please see the [TYP03 documentation](#) for further details.

Installation and Upgrade

There is no better time to check out TYPO3 v9 LTS

Installation and Upgrade

Classic Installation Method

- Official *classic* installation procedure under Linux/Mac OS X (DocumentRoot for example `/var/www/site/htdocs`):

```
$ cd /var/www/site/  
$ wget --content-disposition get.typo3.org/9  
$ tar xzf typo3_src-9.5.0.tar.gz  
$ cd htdocs  
$ ln -s ../typo3_src-9.5.0 typo3_src  
$ ln -s typo3_src/index.php  
$ ln -s typo3_src/typo3  
$ touch FIRST_INSTALL
```

- Symbolic links under Microsoft Windows:
 - Use junction under Windows XP/2000
 - Use `mklink` under Windows Vista and Windows 7 and higher

Installation and Upgrade

Installation Using `composer`

- Installation using `composer` under Linux, Mac OS X and Windows 10:

```
$ cd /var/www/site/
```

```
$ composer create-project typo3/cms-base-distribution typo3 ^9
```

- Alternatively, create your custom `composer.json` file and run:

```
$ composer install
```

Further details and examples for `composer.json` files are available at:

<https://composer.typo3.org>

Installation and Upgrade

Upgrade to TYPO3 v9 LTS

- Upgrades only possible from TYPO3 v8 LTS
- TYPO3 < v8 LTS should be updated to TYPO3 version 8.7 first
- Upgrade instructions:
https://wiki.typo3.org/Upgrade#Upgrading_to_9.5_Long_Term_Support
- Official TYPO3 guide "TYPO3 Installation and Upgrading":
<https://docs.typo3.org/typo3cms/InstallationGuide>
- General approach:
 - Check minimum system requirements (PHP, MySQL, etc.)
 - Review **deprecation_*.log** in old TYPO3 instance
 - Update all extensions to the latest version
 - Deploy new sources and run Install Tool -> Upgrade Wizard
